# Operation Manual 

Goodrive350 IP55<br>High-ingress Protection Series VFD

| No. | Change description | Version | Release date |
| :---: | :---: | :---: | :---: |
| 1 | First release | V1.0 | September 2020 |
| 2 | 1. Updated the preface. <br> 2. Updated the content of function codes. <br> 3. Added the profile and mounting dimensions of 6 power models. | V1.1 | January 2021 |
| 3 | Updated the section 3.6. | V1.2 | April 2021 |
| 4 | 1. Added section 2.7 "Safety standard related data" <br> 2. Updated section 3.3 <br> 3. Updated the name of PE terminal in section 4.3.2 and deleted the duplicated COM terminal record in section 4.4.1 <br> 4. Updated the keypad diagrams and content in Chapter 5 <br> 5. Updated the function codes in Chapter 5 and Chapter 6 <br> 6. Updated the table in section 7.5.1 <br> 7. Added IO expansion 2 (EC-IO502-00), Ethernet/IP communication card (EC-TX510), Modbus TCP communication card (EC-TX515), 24V simplified PG card (EC-PG507-24), GPRS card (EC-IC501-2) in Appendix A <br> 8. Updated the data in Table D-4 <br> 9. Changed the short connection between PW and +24 V terminals to PW and COM terminals the in Figure 4-15 and Figure 4-16 <br> 10. Added Appendix G "Energy efficiency data" | V1.3 | March 2022 |
| 5 | 1. Added information about -NS models (with EMC filter board and input switch removed) in section 3.5, 3.6, 4.3.2; <br> 2. Added function codes P06.23-P06.26, P17.57-P17.58; updated function code, including P11.08 (value 3, 4 are added for the ones place), P28.25; <br> 3. In Appendix A, added content of 4G expansion card, combine CANopen communication card and CAN master/slave control card to CAN multi-protocol communication card EC-TX505C, updated EC-PG505-24 card to EC-PG505-24B; <br> 4. Changed "IEC 60439-1" to "IEC 61439-1" in Appendix B; <br> 5. Updated dimension information in Appendix C and added dimension information for -NS models; <br> 6. Updated tables in Appendix D and Appendix G. | V1.4 | September 2022 |

## Preface

Thank you for choosing Goodrive350 IP55 high-ingress protection series VFD.
The Goodrive350 IP55 high-ingress protection series VFD is a high-performance and multipurpose VFD aiming to integrate the driving of synchronous motors and asynchronous motors, and torque control, speed control with position control. It is armed with advanced vector control technology and the latest digital processor dedicated for motor control, thus enhancing product reliability and adaptability to the environment. The Goodrive350 IP55 high-ingress protection series VFD adopts customized and industrialized design to realize excellent control performance through optimized functions and flexible applications.

To meet the basic needs of customers, VFDs of power range from 4 to 110 kW are developed for Goodrive350 IP55 high-ingress protection series VFDs. To meet diversified customer demands, the Goodrive350 IP55 high-ingress protection series VFD provides abundant expansion cards including programmable expansion card, PG card, communication card and I/O expansion card to achieve various functions as needed.
The programmable expansion card adopts mainstream development environment for customers to carry out secondary development easily, fulfilling varied customized needs and reducing customer cost.
PG card supports a variety of encoders like incremental encoders and resolver-type encoders, in addition, it also supports pulse reference and frequency-division output. PG card adopts digital filter technology to improve EMC performance and to realize stable transmission of the encoder signal over a long distance. It is equipped with encoder offline detection function to contain the impact of system faults.
The Goodrive350 IP55 high-ingress protection series VFD supports multiple kinds of popular communication modes to realize complicated system solutions. It can be connected to the internet with optional wireless communication card, by which users can monitor the VFD state anywhere any time via mobile APP.
The Goodrive350 IP55 high-ingress protection series VFD uses high power density design. Some power ranges carry built-in DC reactor and brake unit to save installation space. Through overall EMC design, it can satisfy the low noise and low electromagnetic interference requirements to cope with challenging grid, temperature, humidity and dust conditions, thus greatly improving product reliability.
This operation manual presents installation wiring, parameter setup, fault diagnosis and trouble shooting, and precautions related to daily maintenance. Read through this manual carefully before installation to ensure that the Goodrive350 IP55 high-ingress protection series VFD is installed and operated in a proper manner to give full play to its excellent performance and powerful functions.
If the end user is a military unit or the product is used for weapon manufacturing, please comply with relevant export control regulations in the Foreign Trade Law of the People's Republic of China, and complete necessary formalities.
Our company reserves the right to update the information of our products.

1.4.4 Scrap treatment ..... 4
2 Precautions for Quick Application ..... 5
2.1 What this chapter contains ..... 5
2.2 Unpack inspection ..... 5
2.3 Application confirmation ..... 5
2.4 Environment confirmation ..... 5
2.5 Installation confirmation ..... 6
2.6 Basic commissioning ..... 6
2.7 Safety standard related data ..... 7
3 Product Overview ..... 8
3.1 What this chapter contains ..... 8
3.2 Basic principle ..... 8
3.3 Product specification ..... 9
3.4 Product nameplate ..... 11
3.5 Product model ..... 11
3.6 Rated values ..... 12
3.7 Structure diagram ..... 13
4 Installation Guide ..... 14
4.1 What this chapter contains ..... 14
4.2 Mechanical installation. ..... 14
4.2.1 Installation environment ..... 14
4.2.2 Installation direction ..... 15
4.2.3 Installation mode ..... 15
4.2.4 Single-unit installation ..... 16
4.2.5 Multiple-unit installation ..... 17
4.2.6 Vertical installation ..... 18
4.2.7 Tilted installation. ..... 19
4.3 Standard wiring of main circuit ..... 20
4.3.1 Wiring diagram of main circuit ..... 20
4.3.2 Main circuit terminal diagram ..... 21
4.3.3 Wiring process of the main circuit terminals ..... 23
4.4 Standard wiring of control circuit ..... 24
4.4.1 Wiring diagram of basic control circuit ..... 24
4.4.2 Input/output signal connection diagram ..... 26
4.5 Wiring protection ..... 27
4.5.1 Protect the VFD and input power cable in short-circuit ..... 27
4.5.2 Protect the motor and motor cable in short circuit ..... 28
4.5.3 Protect motor and prevent thermal overload ..... 28
4.5.4 Bypass connection ..... 28
5 Basic Operation Instructions ..... 29
5.1 What this chapter contains ..... 29
5.2 Keypad introduction ..... 29
5.3 Keypad display ..... 32
5.3.1 Displaying stopped-state parameters ..... 32
5.3.2 Displaying running-state parameters ..... 32
5.3.3 Displaying fault information ..... 33
5.4 Operating the VFD through the keypad ..... 33
5.4.1 Enter/exit menu ..... 33
5.4.2 Editing a parameter list. ..... 37
5.4.3 Adding parameters to the parameter list displayed in stopped/running state. ..... 38
5.4.4 Adding parameters to the user defined parameter list ..... 39
5.4.5 Editing user defined parameters ..... 39
5.4.6 Editing parameters in parameter groups ..... 40
5.4.7 Monitoring states ..... 41
5.4.8 Autotuning motor parameters ..... 41
5.4.9 Backing up parameters ..... 42
5.4.10 System settings ..... 42
5.4.11 Power-on setup wizard ..... 42
5.5 Basic operation instruction ..... 43
5.5.1 What this section contains ..... 43
5.5.2 Common commissioning procedures ..... 44
5.5.3 Vector control ..... 47
5.5.4 SVPWM control mode ..... 51
5.5.5 Torque control ..... 59
5.5.6 Motor parameter. ..... 63
5.5.7 Start/stop control ..... 67
5.5.8 Frequency setup ..... 73
5.5.9 Analog input ..... 77
5.5.10 Analog output ..... 79
5.5.11 Digital input ..... 83
5.5.12 Digital output ..... 90
5.5.13 Simple PLC ..... 95
5.5.14 Multi-step speed running ..... 97
5.5.15 PID control ..... 99
5.5.16 Run at wobbling frequency ..... 104
5.5.17 Local encoder input. ..... 105
5.5.18 Commissioning procedures for closed-loop control, position control and spindle positioning ..... 106
5.5.19 Fault handling ..... 111
5.5.20 Tension control solutions ..... 115
6 Function parameter list ..... 120
6.1 What this chapter contains ..... 120
6.2 Function parameter list ..... 120
P00-Basic functions ..... 121
P01-Start/stop control. ..... 124
P02-Parameters of motor 1 ..... 130
P03-Vector control of motor 1 ..... 133
P04-V/F control ..... 139
P05-Input terminals ..... 146
P06-Output terminals ..... 153
P07-HMI ..... 157
P08-Enhanced functions ..... 163
P09-PID control. ..... 170
P10-Simple PLC and multi-step speed control ..... 174
P11-Protection parameters ..... 177
P12-Parameters of motor 2 ..... 183
P13-Control parameters of synchronous motor ..... 186
P14-Serial communication function ..... 188
P15-Functions of communication expansion card 1 ..... 192
P16-Functions of communication expansion card 2 ..... 195
P17-State-check functions ..... 199
P18-Closed-loop control state check ..... 203
P19-Expansion card state check ..... 206
P20—Encoder of motor 1 ..... 208
P21-Position control ..... 211
P22-Spindle positioning ..... 216
P23-Vector control of motor 2 ..... 218
P24-Encoder of motor 2 ..... 220
P25-Expansion I/O card input functions ..... 223
P26-Output functions of expansion I/O card. ..... 226
P27-Programmable expansion card functions ..... 229
P28-Master/slave control functions ..... 231
P90-Tension control in speed mode ..... 234
P91-Tension control in torque mode ..... 237
P92-Tension optimization ..... 240
P93-Tension control status viewing ..... 241
7 Troubleshooting ..... 244
7.1 What this chapter contains ..... 244
7.2 Indications of alarms and faults ..... 244
7.3 Fault reset ..... 244
7.4 Fault history ..... 244
7.5 VFD faults and solutions. ..... 244
7.5.1 Details of faults and solutions ..... 244
7.5.2 Other state ..... 252
7.6 Analysis on common faults ..... 252
7.6.1 Motor fails to work ..... 252
7.6.2 Motor vibrates ..... 253
7.6.3 Overvoltage ..... 254
7.6.4 Undervoltage ..... 254
7.6.5 Unusual heating of motor ..... 255
7.6.6 VFD overheating ..... 256
7.6.7 Motor stalls during ACC ..... 257
7.6.8 Overcurrent ..... 258
7.7 Countermeasures on common interference. ..... 259
7.7.1 Interference on meter switches and sensors ..... 259
7.7.2 Interference on communication ..... 260
7.7.3 Failure to stop and indicator shimmering due to motor cable coupling ..... 261
7.7.4 Leakage current and interference on RCD ..... 261
7.7.5 Live device chassis ..... 262
8 Maintenance and hardware fault diagnosis ..... 263
8.1 What this chapter contains ..... 263
8.2 Periodical inspection ..... 263
8.3 Cooling fan ..... 265
8.4 Capacitor ..... 266
8.4.1 Capacitor reforming ..... 266
8.4.2 Electrolytic capacitor replacement ..... 267
8.5 Power cable ..... 267
9 Communication protocol ..... 268
9.1 What this chapter contains ..... 268
9.2 Modbus protocol introduction ..... 268
9.3 Application of Modbus ..... 268
9.3.1 RS485 ..... 268
9.3.2 RTU mode ..... 271
9.4 RTU command code and communication data ..... 274
9.4.1 Command code: 03H, reading N words ..... 274
9.4.2 Command code: 06 H , writing a word ..... 275
9.4.3 Command code: 08 H , diagnosis ..... 276
9.4.4 Command code: 10H, continuous writing ..... 277
9.4.5 Data address definition. ..... 278
9.4.6 Fieldbus scale ..... 281
9.4.7 Error message response ..... 282
9.4.8 Read/Write operation example ..... 284
9.5 Common communication faults ..... 288
Appendix A Expansion cards ..... 289
A. 1 Model definition ..... 289
A. 2 Dimensions and installation ..... 297
A. 3 Wiring ..... 300
A. 4 I/O expansion card function description ..... 300
A.4.1 IO expansion card 1 (EC-IO501-00) ..... 300
A.4.2 IO expansion card 2 (EC-IO502-00) ..... 302
A. 5 Programmable expansion card (EC-PC502-00) function description ..... 304
A. 6 Communication card ..... 307
A.6.1 Bluetooth communication card (EC-TX501) and WIFI communication card (EC-TX502) ..... 307
A.6.2 PROFIBUS-DP communication card (EC-TX503). ..... 309
A.6.3 Ethernet communication card (EC-TX504) ..... 310
A.6.4 CAN multi-protocol communication card (EC-TX505C) ..... 311
A.6.5 PROFINET communication card (EC-TX509) ..... 312
A.6.6 Ethernet/IP communication card (EC-TX510) and Modbus TCP communicationcard (EC-TX515)314
A. 7 PG expansion card function description ..... 316
A.7.1 Sin/Cos PG card (EC-PG502) ..... 316
A.7.2 UVW incremental PG card (EC-PG503-05) ..... 318
A.7.3 Resolver PG card (EC-PG504-00) ..... 320
A.7.4 Multi-function incremental PG card (EC-PG505-12) ..... 322
A.7.5 24 V incremental PG card (EC-PG505-24B) ..... 325
A.7.6 Simplified incremental PG card (EC-PG507-12) ..... 328
A.7.7 24 V simplified incremental PG card (EC-PG507-24) ..... 329
A. 8 loT cards ..... 333
A.8.1 GPRS card (EC-IC501-2). ..... 333
A.8.2 4G card (EC-IC502-2-CN, EC-IC502-2-EU, EC-IC502-2-LA) ..... 334

H. 2 Feedback on INVT VFD manuals ..... 366
H. 3 Documents on the Internet ..... 366

## 1 Safety Precautions

### 1.1 What this chapter contains

Read this manual carefully and follow all safety precautions before moving, installing, operating and servicing the VFD. If these safety precautions are ignored, physical injury or death may occur, or damage may occur to the equipment.
If any physical injury or death or damage to the equipment occur due to neglect of the safety precautions in the manual, our company will not be responsible for any damages and we are not legally bound in any manner.

### 1.2 Safety definition

Danger: Serious physical injury or even death may occur if related requirements are not followed

Warning: Physical injury or damage to the equipment may occur if related requirements are not followed

Note: Procedures taken to ensure proper operation.
Qualified electricians: People working on the device should take part in professional electrical and safety training, receive the certification and be familiar with all steps and requirements of installing, commissioning, operating and maintaining the device to prevent any emergencies.

### 1.3 Warning symbols

Warnings caution you about conditions which can result in serious injury or death and/or damage to the equipment, and advice on how to avoid the danger. Following warning symbols are used in this manual.

| Symbols | Name | Instruction | Abbreviation |
| :---: | :---: | :---: | :---: |
| Danger | Danger | Serious physical injury or even death may occur if related requirements are not followed | $4$ |
| Warning | Warning | Physical injury or damage to the equipment may occur if related requirements are not followed | $4$ |
| Forbid | Electrostatic discharge | Damage to the PCBA board may occur if related requirements are not followed | in |
| Hot | Hot sides | The base of the VFD may become hot. Do not touch. | IIII |
| 4 公 5 min | Electric shock | As high voltage still presents in the bus capacitor after power off, wait for at least five minutes (or $15 \mathrm{~min} / 25 \mathrm{~min}$, depending on the warning symbols on the machine) after power off to prevent electric shock | $4 \text { 公 } 5 \mathrm{~min}$ |
|  | Read manual | Read the operation manual before operating on the equipment |  |
| Note | Note | Procedures taken to ensure proper operation | Note |

### 1.4 Safety guidelines

| $4$ | - Only trained and qualified electricians are allowed to carry out related operations. <br> Do not perform wiring, inspection or component replacement when power supply is applied. Ensure all the input power supplies are disconnected before wiring and inspection, and wait for at least the time designated on the VFD or until the DC bus voltage is less than 36 V . The minimum waiting time is listed in the table below. |  |  |
| :---: | :---: | :---: | :---: |
|  |  | mode | iting |
|  | 380 V | 004G/5R5P-110G | 5 min |
| ! | - Do not refit the VFD unless authorized; otherwise, fire, electric shock or other injuries may occur. |  |  |
| SIIIS | - The base of the radiator may become hot during running. Do not touch to avoid hurt. |  |  |
| A | - The electrical parts and components inside the VFD are electrostatic. Take measures to prevent electrostatic discharge during related operation. |  |  |

### 1.4.1 Delivery and installation

| ! | Install the VFD on fire-retardant material and keep the VFD away from <br> combustible materials. |
| :--- | :--- |
| - Connect the optional brake parts (brake resistors, brake units or feedback units) |  |
| according to the wiring diagram. |  |
| -Do not operate on a damaged or incomplete VFD. <br> Do not touch the VFD with wet items or body parts; otherwise, electric shock may <br> occur. |  |

## Note:

- Select appropriate tools for delivery and installation to ensure a safe and proper running of the VFD and avoid physical injury or death. To ensure physical safety, the installation staff should take mechanical protective measures like wearing exposure shoes and working uniforms.
- Ensure to avoid physical shock or vibration during delivery and installation;
- Do not carry the VFD by its front cover only as the cover may fall off;
- Installation site should be away from children and other public places;
- The VFD should be used in proper environment (see section 4.2.1 "Installation environment" for details);
- Prevent the screws, cables and other conductive parts from falling into the VFD;
- As leakage current of the VFD during running may exceed 3.5 mA , ground properly and ensure the grounding resistance is less than $10 \Omega$. The conductivity of PE grounding conductor is the same with that of the phase conductor. For models higher than 30 kW , the cross sectional area of the PE grounding conductor can be slightly less than the recommended area.
- $R, S$ and $T$ are the power input terminals, and $U, V$ and $W$ are output motor terminals. Connect the input power cables and motor cables properly; otherwise, damage to the VFD may occur.

### 1.4.2 Commissioning and running

| -Disconnect all power sources applied to the VFD before terminal wiring, and wait <br> for at least the time designated on the VFD after disconnecting the power <br> sources. <br> High voltage presents inside the VFD during running. Do not carry out any <br> operation on the VFD during running except for keypad setup. It must be noted <br> that the control terminal of EV1000 inverter is ELV (Extra Low Voltage) circuit, <br> which cannot be connected directly to the accessible terminals of other devices if <br> no protective isolation measure is taken. For instance, RS485 terminal of the <br> inverter can be connected to RS232 interface of the PC only after a converter <br> with protective isolation is connected between them. <br> - The VFD may start up by itself when P01.21 (restart after power cut) is set to 1. <br> Do not get close to the VFD and motor. <br> - The VFD cannot be used as "Emergency-stop device". <br> The VFD cannot act as an emergency brake for the motor; it is a must to install <br> mechanical brake device.$\|$During driving permanent magnet synchronous motor, besides above-mentioned <br> items, the following work must be done before installation and maintenance. <br> 1. Disconnect all the input power sources including main power and control <br> power. <br> 2. Ensure the permanent-magnet synchronous motor has been stopped, and the <br> voltage on output end of the VFD is lower than 36V. <br> 3. After the permanent-magnet synchronous motor is stopped, wait for at least <br> the time designated on the VFD, and ensure the voltage between "+" and "-" is <br> lower than 36V. <br> 4. During operation, it is a must to ensure the permanent-magnet synchronous <br> motor cannot run again by the action of external load; it is recommended to <br> install effective external brake device or disconnect the direct electrical <br> connection between permanent-magnet synchronous motor and the VFD. |
| :---: | :--- |

## Note:

- Do not switch on or switch off input power sources of the VFD frequently.
- For VFDs that have been stored for a long time, set the capacitance and carry out inspection and pilot run on the VFD before use.
- Close the front cover before running; otherwise, electric shock may occur.

### 1.4.3 Maintenance and component replacement

| -Only well-trained and qualified professionals are allowed to perform <br> maintenance, inspection, and component replacement on the VFD. <br> Disconnect all the power sources applied to the VFD before terminal wiring, and <br> wait for at least the time designated on the VFD after disconnecting the power <br> sources. <br> Take measures to prevent screws, cables and other conductive matters from <br> falling into the VFD during maintenance and component replacement. |
| :---: | :--- |

Note:

- Use proper torque to tighten the screws.
- Keep the VFD and its parts and components away from combustible materials during maintenance and component replacement.
- Do not carry out insulation voltage-endurance test on the VFD, or measure the control circuits of the VFD with megameter.
- Take proper anti-static measures on the VFD and its internal parts during maintenance and component replacement.

### 1.4.4 Scrap treatment

The heavy metals inside the VFD should be treated as industrial effluent.
When the life cycle ends, the product should enter the recycling system. Dispose of it separately at an appropriate collection point instead of placing it in the normal waste stream.

## 2 Precautions for Quick Application

### 2.1 What this chapter contains

This chapter introduces the basic principles required during installation commissioning. Users can realize quick installation commissioning by following these principles.

### 2.2 Unpack inspection

Check as follows after receiving products.

1. Check whether the packing box is damaged or dampened. If yes, contact local dealers or INVT offices.
2. Check the model identifier on the exterior surface of the packing box is consistent with the purchased model. If no, contact local dealers or INVT offices.
3. Check whether the interior surface of packing box is improper, for example, in wet condition, or whether the enclosure of the VFD is damaged or cracked. If yes, contact local dealers or INVT offices.
4. Check whether the nameplate of the VFD is consistent with the model identifier on the exterior surface of the packing box. If not, contact local dealers or INVT offices.
5. Check whether the accessories (including user's manual, control keypad and expansion card units) inside the packing box are complete. If not, contact local dealers or INVT offices.

### 2.3 Application confirmation

Check the following items before operating on the VFD.

1. Verify the load mechanical type to be driven by the VFD, and check whether overload occurred to the VFD during actual application, or whether the VFD power class needs to be enlarged?
2. Check whether the actual running current of load motor is less than rated VFD current.
3. Check whether the control precision required by actual load is the same with the control precision provided by the VFD.
4. Check whether the grid voltage is consistent with rated VFD voltage.
5. Check whether the functions required need an optional expansion card to be realized.

### 2.4 Environment confirmation

Check the following items before use.

1. Check whether the ambient temperature of the VFD during actual application exceeds $40^{\circ} \mathrm{C}$, if yes, derate $1 \%$ for every additional $1^{\circ} \mathrm{C}$. In addition, do not use the VFD when the ambient temperature exceeds $50^{\circ} \mathrm{C}$.
Note: For cabinet-type VFD, its ambient temperature is the air temperature inside the cabinet.
2. Check whether ambient temperature of the VFD during actual application is below $-10^{\circ} \mathrm{C}$, if yes, install heating facility.
Note: For cabinet-type VFD, its ambient temperature is the air temperature inside the cabinet.
3. Check whether the altitude of the application site exceeds 1000 m . When the installation site altitude exceeds 1000 m , derate $1 \%$ for every increase of 100 m ; when the installation site altitude exceeds 3000 m , consult the local INVT dealer or office.
4. Check whether the humidity of application site exceeds $90 \%$, if yes, check whether condensation occurred, if condensation does exist, take additional protective measures.
5. Check whether there is direct sunlight or animal intrusion in the application site, if yes, take additional protective measures.
6. Check whether there is dust, explosive or combustible gases in the application site, if yes, take additional protective measures.

### 2.5 Installation confirmation

## After the VFD is installed properly, check the installation condition of the VFD.

1. Check whether the input power cable and current-carrying capacity of the motor cable fulfill actual load requirements.
2. Check whether peripheral accessories (including input reactors, input filters, output reactors, output filters, DC reactors, brake units and brake resistors) of the VFD are of correct type and installed properly; check whether the installation cables fulfill requirements on current-carrying capacity.
3. Check whether the VFD is installed on fire-retardant materials; check whether the hot parts (reactors, brake resistors, etc.) are kept away from combustible materials.
4. Check whether all the control cables are routed separately with power cables based on EMC requirement.
5. Check whether all the grounding systems are grounded properly according to VFD requirements.
6. Check whether installation spacing of the VFD complies with the requirements in operation manual.
7. Check whether installation mode of the VFD complies with the requirements in operation manual. Vertical installation should be adopted whenever possible.
8. Check whether external connecting terminals of the VFD are firm and tight enough, and whether the moment is up to the requirement.
9. Check whether there are redundant screws, cables or other conductive objects inside the VFD, if yes, take them out.

### 2.6 Basic commissioning

Carry out basic commissioning according to the following procedures before operating on the VFD.

1. Select motor type, set motor parameters and select VFD control mode according to actual motor parameters.
2. Whether autotuning is needed? If possible, disconnect the motor load to carry out dynamic parameter autotuning; if the load cannot be disconnected, perform static autotuning.
3. Adjust the acceleration and deceleration time based on actual working conditions of the load.
4. Jogging to carry out device commissioning. Check whether the motor running direction is consistent with the direction required, if no, it is recommended to change the motor running direction by exchanging the motor wiring of any two phases.
5. Set all the control parameters, and carry out actual operation.

### 2.7 Safety standard related data

| IEC/EN 61508 (Class A system) |  |  |  |  |  | ISO 13849** |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SIL | PFH | HFT | SFF | $\lambda d$ u | $\lambda$ ddd | PTI $^{\star}$ | PL | CCF | DC | Category |
| 2 | $8.73 \times 10^{-10}$ | 1 | $71.23 \%$ | $1.79 \times 10^{-9}$ | 0 | 1 year | d | 57 | $60 \%$ | 3 |

* PTI: Proof test interval
** Depends on the classification defined on the EN ISO 13849-1.

## 3 Product Overview

### 3.1 What this chapter contains

This chapter mainly introduces the operation principles, product features, layouts, nameplates and model instructions.

### 3.2 Basic principle

The Goodrive350 IP55 high-ingress protection series VFD is used to control asynchronous AC induction motor and permanent-magnet synchronous motor. The figure below shows the main circuit diagram of the VFD. The rectifier converts 3PH AC voltage into DC voltage, and the capacitor bank of intermediate circuit stabilizes the DC voltage. The inverter converts DC voltage into the AC voltage used by AC motor. When the circuit voltage exceeds the maximum limit value, external brake resistor will be connected to intermediate DC circuit to consume the feedback energy.

Figure 3-1 (015G/018P and below) main circuit diagram

Figure 3-2 018G/022P-110G (inclusive) main circuit diagram

## Note:

1. VFDs of $018 \mathrm{G} / 022 \mathrm{P}-110 \mathrm{G}$ (inclusive) are equipped with built-in DC reactors.
2. Built-in brake units are included in the standard configuration of $037 \mathrm{G} / 045 \mathrm{P}$ or lower models. The models that carry built-in brake units can also be connected to external brake resistors. The brake resistors are optional parts.
3. VFDs of 045G/055P-110G models support optional built-in brake units. A VFD model with built-in brake unit ends with "-B", for example, GD350-045G/055P-45-AS-B.

### 3.3 Product specification

| Function description |  | Specification |
| :---: | :---: | :---: |
| Power input | Input voltage (V) | -4 model: 3PH 380V (-15\%)-440V (+10\%) |
|  | Input current (A) | Refer to section 3.6 Rated values. |
|  | Input frequency (Hz) | 50 Hz or 60 Hz , allowable range: $47-63 \mathrm{~Hz}$ |
| Power output | Output voltage (V) | 0-input voltage |
|  | Output current (A) | Refer to section 3.6 Rated values. |
|  | Output power (kW) | Refer to section 3.6 Rated values. |
|  | Output frequency (Hz) | $0-400 \mathrm{~Hz}$ |
| Technical control performance | Control mode | Space voltage vector control, sensorless vector control (SVC), and feedback vector control (FVC) |
|  | Motor type | Asynchronous motor, permanent-magnet synchronous motor |
|  | Speed regulation ratio | Asynchronous motor 1: 200 (SVC); Synchronous motor 1: 20 (SVC), 1:1000 (FVC) |
|  | Speed control precision | $\pm 0.2 \%$ (SVC), $\pm 0.02 \%$ (FVC) |
|  | Speed fluctuation | $\pm 0.3 \%$ (SVC) |
|  | Torque response | <20ms SVC) , <10ms (FVC) |
|  | Torque control precision | 10\% (SVC) , 5\% (FVC) |
|  | Starting torque | Asynchronous motor: $0.25 \mathrm{~Hz} / 150 \%$ (SVC) Synchronous motor: $2.5 \mathrm{~Hz} / 150 \%$ (SVC) 0Hz/200\% (FVC) |
|  | Overload capacity | G type: <br> $150 \%$ of rated current: 1 min ; $180 \%$ of rated current: 10 s ; $200 \%$ of rated current: 1 s ; P type: <br> $120 \%$ of rated current: 1 min ; |
| Running control performance | Frequency setup mode | Digital, analog, pulse frequency, multi-step speed running, simple PLC, PID, Modbus communication, PROFIBUS communication, etc; <br> Realize switch-over between the set combination and the set channel |
|  | Automatic voltage regulation function | Keep the output voltage constant when grid voltage changes |
|  | Fault protection function | Fault protection function <br> Provide over 30 kinds of fault protection functions: overcurrent, overvoltage, undervoltage, over-temperature, phase loss and overload, etc |
|  | Speed tracking restart function | Realize impact-free starting of the motor in rotating |
|  | Retension at transient voltage drop | Keeps running with regenerative energy when the grid transiently drops. |

| Function description |  | Specification |
| :---: | :---: | :---: |
|  | Motor switchover | Supports two groups of motor parameters to control motor switchover. |
| Peripheral interface | Terminal analog input resolution | No more than 20 mV |
|  | Terminal digital input resolution | No more than 2ms |
|  | Analog input | 2 inputs, Al1: 0-10V/0-20mA; Al2: -10-10V |
|  | Analog output | 1 output, AO1: 0-10V /0-20mA |
|  | Digital input | Four regular inputs; max. frequency: 1 kHz ; internal impedance: $3.3 \mathrm{k} \Omega$ <br> Two high-speed inputs; max. frequency: 50 kHz ; supports quadrature encoder input; with speed measurement function |
|  | Digital output | One high-speed pulse output; max. frequency: 50 kHz One Y terminal open collector output |
|  | Relay output | Two programmable relay outputs RO1A NO, RO1B NC, RO1C common port RO2A NO, RO2B NC, RO2C common port Contact capacity: 3A/AC250V, 1A/DC30V |
|  | Extension interface | Three extension interfaces: SLOT1, SLOT2, SLOT3 Expandable PG card, programmable expansion card, communication card, I/O card, etc |
| Others | Installation mode | Support wall-mounting and flange-mounting |
|  | Operation ambient temperature | $-10-50^{\circ} \mathrm{C}$ |
|  | Ingress protection rating | IP55 |
|  | Cooling mode | Forced-air cooling |
|  | Brake unit | Built-in brake units are included in the standard configuration of 37 kW or lower VFDs. VFDs of $45-110 \mathrm{~kW}$ support optional built-in brake units. A VFD model with built-in brake unit ends with "-B", for example, GD350-045G/055P-45-AS-B. |
|  | EMC filter | Conducted emissions of all models meet the requirements of C3 in the IEC/EN 61800-3 standard. The -AS models offers the 30 m motor cable, meeting the C 3 requirements. External filter is optional: Conducted emission can meet the requirements of C2 in the IEC/EN 61800-3 standard. <br> Note: It is required to observe the EMC compliance required by the appendix of the manual. The motor and motor cables shall be selected based on technical requirements specified in the appendix of the manual. |
|  | STO certification level | Meet the SIL2 level |

### 3.4 Product nameplate

Figure 3-3 Product nameplate

Note: This is an example of the nameplate of standard Goodrive350 IP55 products. The CE/TUV/IP55 marking on the top right will be marked according to actual certification conditions.

### 3.5 Product model

## Note:

1. There is no $P$ type mechine for 110 kW power stage.
2. The input current of 004G/5R5P-055G/075P VFDs are measured in cases where the input voltage is 380 V without additional reactors;
3. The rated output current is the output current when the output voltage is 380 V ;
4. Within allowable input voltage range, the output current/power cannot exceed rated output current/power.

### 3.7 Structure diagram

The VFD layout is shown in the figure below (take a 015G/018P VFD as an example).
Figure 3-5 Structure diagram

| No. | Name | Instruction |
| :---: | :---: | :--- |
| 1 | Upper cover | Protect internal components and parts |
| 2 | Keypad | For details, see section 5.4 "Operating the VFD through the <br> keypad" |
| 3 | Lower cover | Protect internal components and parts |
| 4 | Expansion card | Optional part. For details, see Appendix A "Expansion cards" |
| 5 | Baffle of control board | Protect the control board and install expansion card |
| 6 | Cooling fan | For details, see 8 "Maintenance" |
| 7 | Keypad interface | Connect the keypad |
| 8 | Nameplate | For details, see 3 "Product Overview" |
| 9 | Main circuit terminal | For details, see 4 "Installation Guide" |
| 10 | Control terminals | For details, see 4 "Installation Guide" |
| 11 | Waterproof connector | Lock and secure connection cables |
| 12 | POWER indicator | Power indicator |
| 13 | Label of GD350 IP55 <br> product series | For details, see section 3.5 "Product model" of this chapter |
| 14 | Baffle of fan | Protect the fan. |
| 15 | Switch handle | Control the main circuit power. |

## 4 Installation Guide

### 4.1 What this chapter contains

This chapter introduces the mechanical and electrical installations of the VFD.

| - Only well trained and qualified professionals are allowed to carry out the |
| :---: | :--- |
| operations mentioned in this chapter. Please carry out operations according to |
| instructions presented in 1 "Safety Precautions". Ignoring these safety |
| precautions may lead to physical injury or death, or device damage. |
| Ensure the VFD power is disconnected before installation. If the VFD has been |
| powered on, disconnect the VFD and wait for at least the time designated on the |
| VFD, and ensure the POWER indicator is off. Users are recommended to use a |
| multimeter to check and ensure the VFD DC bus voltage is below 36V. |
| Installation must be designed and done according to applicable local laws and |
| regulations. INVT does not assume any liability whatsoever for any installation |
| which breaches local laws and regulations. If recommendations given by INVT |
| are not followed, the VFD may experience problems that the warranty does not |
| cover. |

### 4.2 Mechanical installation

### 4.2.1 Installation environment

Installation environment is essential for the VFD to operate at its best in the long run. The installation environment of the VFD should meet the following requirements.

| Environment | Condition |
| :---: | :---: |
| Installation site | Indoors |
| Ambient temperature | - $-10-+50^{\circ} \mathrm{C}$; <br> - When the ambient temperature exceeds $40^{\circ} \mathrm{C}$, derate $1 \%$ for every additional $1^{\circ} \mathrm{C}$; <br> - It is not recommended to use the VFD when the ambient temperature is above $50^{\circ} \mathrm{C}$; <br> - In order to improve reliability, do not use the VFD in cases where the temperature changes rapidly; <br> - When the VFD is used in a closed space eg control cabinet, use cooling fan or air conditioner to prevent internal temperature from exceeding the temperature required; <br> - When the temperature is too low, if restart a VFD which has been idled for a long time, it is required to install external heating device before use to eliminate the freeze inside the VFD, failing to do so may cause damage to the VFD. |
| Humidity | - The relative humidity ( RH ) of the air is less than $90 \%$; <br> - The max RH cannot exceed $60 \%$ in the environment where there are corrosive gases. |
| Storage temperature | $-30-+60^{\circ} \mathrm{C}$ |
| Running environment | The installation site should meet the following requirements. <br> - Away from electromagnetic radiation sources; <br> - Away from oil mist, corrosive gases and combustible gases; <br> - Ensure foreign object like metal powder will not fall into the VFD (do not install the VFD onto combustible object like wood); <br> - Away from radioactive substance and combustible objects; |

| Environment | Condition |
| :---: | :---: |
|  | - Away from corrosive liquid; <br> - Low salt content; <br> - No direct sunlight |
| Altitude | - Below 1000 m ; <br> - When the installation site altitude exceeds 1000 m , derate $1 \%$ for every increase of 100 m ; when the installation site altitude exceeds 3000 m , consult the local INVT dealer or office. |
| Vibration | Up to $5.8 \mathrm{~m} / \mathrm{s}^{2}(0.6 \mathrm{~g})$ |
| Installation direction | Install the VFD vertically to ensure good heat dissipation effect. |

Note: VFDs must be installed in ventilated environments free of corrosive gases and conductive dust.

### 4.2.2 Installation direction

The VFD can be installed on the wall or in a cabinet.
The VFD must be installed vertically. Check the installation position according to following requirements. See Appendix C "Dimension drawings" for detailed outline dimensions.

Figure 4-1 Installation direction of the VFD
OK

a. Vertical installation

b.Horizontal installation

c.Transverse installation

### 4.2.3 Installation mode

The VFDs can be installed in two modes, depending on the different VFD dimensions:

Figure 4-2 Installation mode

Wall-mounting

Flange-mounting
(1) Mark the position of the installation hole. See Appendix C "Dimension drawings" for the position of installation hole;
(2) Mount the screws or bolts onto the designated position;
(3) Put the VFD on the wall;
(4) Tighten the fixing screws on the wall.

Note: Flange-mounting plate is a must for 004G/5R5P-110G VFDs that adopt flange-mounting mode.

### 4.2.4 Single-unit installation

Figure 4-3 Single-unit installation

Note: The min. dimension of A, B, and C is 100 mm .

### 4.2.5 Multiple-unit installation

Figure 4-4 Parallel installation

## Note:

1. When users install VFDs in different sizes, align the top of each VFD before installation for the convenience of future maintenance.
2. The min dimension of $A, B$, and $C$ is 100 mm , and the dimention of $D$ can be 0 , which is zero-clearance parallel installation is supported.
4.2.6 Vertical installation

Figure 4-5 Vertical installation

Note: During vertical installation, users must install windshield, otherwise, the VFD will experience mutual interference, and the heat dissipation effect will be degraded.

### 4.2.7 Tilted installation

Figure 4-6 Tilted installation

Note: During tilted installation, it is a must to ensure the air inlet duct and air outlet duct are separated from each other to avoid mutual interference.

### 4.3 Standard wiring of main circuit

### 4.3.1 Wiring diagram of main circuit

Figure 4-7 Main circuit wiring diagram

## Note:

1. The fuse, DC reactor, brake unit, brake resistor, input reactor, input filter, output reactor and output filter are optional parts. See Appendix D "Optional peripheral accessories" for details.
2. When connecting the brake resistor, take off the yellow warning sign marked with PB, (+) and (-) on the terminal block before connecting the brake resistor wire, otherwise, poor contact may occur.

| $(-)$ | Brake unit terminal 2 | PB and (+) are connected with the terminals of |
| brake resistor. |  |  |

## Note:

1. It is not recommended to use asymmetrical motor cable. If there is a symmetrical grounding conductor in the motor cable besides the conductive shielded layer, ground the grounding conductor on the VFD end and motor end.
2. Brake resistor, brake unit and DC reactor are optional parts.
3. Route the motor cable, input power cable and control cables separately.
4. "None" means this terminal is not for external connection.
5. GD series VFDs cannot share the DC bus with CH series VFDs.
6. When sharing the DC bus, the VFDs must be the same in power and must be simultaneously powered on or off.
7. In shared DC bus running mode, current balance on the VFD input side must be considered during wiring, and equalizing reactors are recommended to be configured.

### 4.3.3 Wiring process of the main circuit terminals

1. Connect the grounding line of the input power cable to the grounding terminal (PE) of the VFD, and connect the 3PH input cable to R, S and T terminals and tighten up.
2. Connect the grounding line of the motor cable to the grounding terminal of the VFD, and connect 3PH motor cable to $\mathrm{U}, \mathrm{V}$ and W terminals and tighten up.
3. Connect the brake resistor which carries cables to the designated position.
4. Fix all the cables outside the VFD mechanically if allowed.

Figure 4-14 Screw installation diagram

### 4.4 Standard wiring of control circuit

### 4.4.1 Wiring diagram of basic control circuit

Figure 4-15 Wiring diagram of control circuit

Note: If wire-passing board outlet space is insufficient when all terminals on the control board are wired, cut the knock-out hole on the lower cover for wire outlet. If a dangerous situation occurs when the knock-out hole is cut for a purpose but not wire outlet, we will not bear any responsibility.

| Terminal name | Instruction |  |
| :---: | :---: | :---: |
| +10V | The VFD provides +10.5 V power |  |
| Al1 | 1. Input range: Al1 voltage/current can choose $0-10 / 0-20 \mathrm{~mA}$; Al2: -10V-+10V voltage; <br> 2. |  | output; <br> 2. Safety input signal wires use shielded wire whose length is <br> within 25m; <br> 3. H1 and H 2 terminals are short connected to +24 V by default; it <br> is required to remove the jumper on the terminal before using <br> STO function. |

### 4.4.2 Input/output signal connection diagram

Set NPN /PNP mode and internal/external power via U-shaped jumper. PNP internal mode is adopted by default.

Figure 4-16 Position of U-shaped jumper

If input signal comes from NPN transistors, set the U-shaped jumper between +24 V and PW based on the power used according to the figure below.

Figure 4-17 NPN mode

If input signal comes from PNP transistor, set the U-shaped jumper based on the power used according to the figure below.

Figure 4-18 PNP mode

### 4.5 Wiring protection

### 4.5.1 Protect the VFD and input power cable in short-circuit

Protect the VFD and input power cable during short-circuit to avoid thermal overload.
Carry out protective measures according to the following requirements.
Figure 4-19 Fuse configuration

Note: Select the fuse according to operation manual. During short-circuit, the fuse will protect input power cables to avoid damage to the VFD; when internal short-circuit occurred to the VFD, it can protect neighboring equipment from being damaged.

### 4.5.2 Protect the motor and motor cable in short circuit

If the motor cable is selected based on rated VFD current, the VFD will be able to protect the motor cable and motor during short circuit without other protective devices.

If the VFD is connected to multiple motors, it is a must to use a separated thermal overload switch or breaker to protect the cable and motor, which may require the fuse to cut off the short circuit current.

### 4.5.3 Protect motor and prevent thermal overload

According to the requirements, the motor must be protected to prevent thermal overload. Once overload is detected, users must cut off the current. The VFD is equipped with motor thermal overload protection function, which will block output and cut off the current (if necessary) to protect the motor.

### 4.5.4 Bypass connection

In some critical occasions, industrial frequency conversion circuit is necessary to ensure proper operation of the system when VFD fault occurs.
In some special cases, eg, only soft startup is needed, it will converts to power-frequency operation directly after soft startup, corresponding bypass link is also needed.

Do not connect any power source to VFD output terminals U, V and W. The voltage applied to motor cable may cause permanent damage to the VFD.

If frequent switch-over is needed, users can use the switch which carries mechanical interlock or a contactor to ensure motor terminals will not be connected to input power cables and VFD output ends simultaneously.

## 5 Basic Operation Instructions

### 5.1 What this chapter contains

This chapter tells users how to use the VFD keypad and the commissioning procedures for common functions of the VFD.

### 5.2 Keypad introduction

LCD keypad is included in the standard configuration of GD350 IP55 series VFDs. Users can control the VFD start/stop, read state data and set parameters via keypad.

Figure 5-1 Keypad diagram

## Note:

1. LCD keypad is armed with real-time clock, which can run properly after power off when installed with batteries. The clock battery (type: CR2032) should be purchased by the user separately.
2. LCD keypad support parameter-copy.

| No. | Name | Instruction |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 1 | State Indicator | (1) | RUN | Running indicator; <br> LED off - the VFD is stopped; <br> LED blinking - the VFD is in parameter autotune <br> LED on - the VFD is running |
|  |  | 2) | TRIP | Fault indicator; <br> LED on - in fault state <br> LED off - in normal state <br> LED blinking - in pre-alarm state |
|  |  | (3) | QUICK/JOG | Short-cut key indicator, which displays different state under different functions, see definition of QUICK/JOG key for details |

| No. | Name | Instruction |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | Display <br> area | $(12)$ | LCD | Display <br> screen | $240 \times 160$ dot-matrix LCD; display three <br> monitoring parameters or six sub-menu items <br> simultaneously |
| 4 | Others | $(13)$ | RJ45 <br> interface | RJ45 <br> interface | RJ45 interface is used to connect to the VFD. <br> holder |
|  | Clock battery <br> holder | The battery holder is used for replacing or <br> installing a battery for the clock. |  |  |  |
|  | $(15)$ | USB <br> terminal | mini USB <br> terminal | Mini USB terminal is used to connect to the USB <br> flash drive through an adapter. |  |

The LCD has different display areas, which displays different contents under different interfaces. The figure below is the main interface of stop state.

Figure 5-2 Main interface of LCD

| Area | Name | Used to |
| :---: | :---: | :--- |
| Header A | Real-time display area | Display the real-time; clock battery is not included; the time <br> needs to be reset when powering on the VFD |
| Header B | VFD running state <br> display area | Display the running state of the VFD: <br> 1. Display motor rotating direction: "Fwd" - Run forward during <br> operation; "Rev" - Run reversely during operation; "Forbid" - <br> Reverse running is forbidden; <br> 2. Display VFD running command channel: "Local"-Keypad; <br> "Terminal"-Terminal; "Remote"-Communication <br> 3. Display current running state of the VFD : "Ready" - The VFD <br> is in stop state (no fault); "Run" - The VFD is in running state; <br> "Jog"-The VFD is in jogging state; "Pre-alarm"-the VFD is under <br> pre-alarm state during running; "Fault"-VFD fault occurred. |
| Header C | VFD model display <br> area | Display VFD model: "GD350 - current VFD is GD350 series <br> VFD |
| Display D | Parameter names and <br> function codes on the <br> VFD homepage | Display a maximum of three parameter names and function <br> codes on the homepage. The parameters displayed on the <br> homepage can be managed. |
| Display E | Values of parameters <br> on the VFD homepage | Display the values of parameters on the VFD homepage, <br> which are updated in real time. |

| Area | Name | Used to |
| :---: | :---: | :--- |
| Footer F | Corresponding menu <br> of function keys (4), <br> (5), and (6) | Indicate the menus corresponding to function keys (4), (5) and <br> (6). The corresponding menus of function keys (4), (5) and (6) <br> vary with interfaces, and the content displayed in this area <br> varies also. |

### 5.3 Keypad display

The VFD keypad can display the stopped-state parameters, running-state parameters, function parameter editing status, and fault alarm status.

### 5.3.1 Displaying stopped-state parameters

When the VFD is in stopped state, the keypad displays stopped-state parameters, and this interface is the main interface during power-up by default. In stopped state, parameters in various states can be displayed. Press $\qquad$ or to shift the displayed parameter up or down.

Figure 5-3 Stopped-state parameter display 1

| $16: 02: 35$ | Fwd | Local | Ready | GD350 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Press $\langle$ or $>$ to switch between different display styles, including list display style and progress bar display style.

Figure 5-4 Stopped-state parameter display 2

The stopped-state parameter display list is user defined, and each state variable function code can be added to the stopped-state parameter display list as needed. A function code which has been added to the stopped-state parameter display list can also be deleted or shifted.

### 5.3.2 Displaying running-state parameters

After receiving valid running command, the VFD will enter running state, and the keypad displays running state parameter with RUN indicator on the keypad turning on. In running state, multiple kinds of state parameters can be displayed. Press or to shift the displayed parameter up or down.

Figure 5-5 Running-state parameter display 1

| 16:02:35 Fwd | Local | Run | GD350 | 16:02:35 | Fwd | Local | Run | GD350 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Output Freq P17.01 Hz |  | $50.00$ |  | Set Freq P17.00 |  |  | $50.00$ |  |
| $\begin{aligned} & \text { Set Freq } \\ & \text { P17.00 } \mathrm{Hz} \end{aligned}$ |  | $50.00$ |  | DC Bus <br> P17.11 |  |  |  |  |

| Parameter | About |  | Menu | Para | eter | About |  | Menu |

Press or to switch between different display styles, including list display style and progress bar display style.

Figure 5-6 Running-state parameter display 2

In running state, multiple kinds of state parameters can be displayed. The running display parameter list is user defined, and each state variable function code can be added to the running display parameter list as needed. A function code which has been added to the running display parameter list can also be deleted or shifted.

### 5.3.3 Displaying fault information

The VFD enters fault alarm display state once fault signal is detected, and the keypad displays fault code and fault information with TRIP indicator on the keypad turning on. Fault reset operation can be carried out via STOP/RSTkey, control terminal or communication command.
The fault code will be kept displaying until fault is removed.
Figure 5-7 Fault alarm display state

| 16:02:35 | Fwd | Local | Fault |
| :--- | :---: | :---: | :---: |
| GD350 |  |  |  |
| Present fault type: <br> Fault code: |  |  |  |
|  | 19 |  |  |
|  |  |  |  |
|  |  |  |  |
|  | Home |  |  |
|  |  | OK |  |

### 5.4 Operating the VFD through the keypad

Various operations can be performed on the VFD through the keypad, including entering/exiting menu, parameter selection, list modification and parameter addition.

### 5.4.1 Enter/exit menu

The keypad displays three main menus at the home interface by default: Parameter, About, and Menu. The following figure shows how to enter the Parameter main menu and how to operate under this main menu.

Figure 5-8 Enter/exit menu diagram 1

The following figure shows how to enter the Menu main menu and how to operate under this main menu.

Figure 5-9 Enter/exit menu diagram 2

The keypad menu setup is shown as follows.

| Level 1 | Level 2 | Level 3 | Level 4 |
| :---: | :---: | :---: | :---: |

### 5.4.2 Editing a parameter list

The parameters in the parameter list in stopped state can be added as needed (through the menu of user defined home parameters), and the list can also be edited such as "Move up", "Move down", "Delete from the list", and "Restore default". The edit function is shown in the following.

Figure 5-10 List edit diagram 1

Press key to enter edit interface, select the operation needed, and press key, $>$ key or key to confirm the edit operation and return to the previous menu (parameter list), the returned list is the list edited. If key or key is pressed in edit interface without any selection, it will return to the previous menu (parameter list remain unchanged).

Note: For the parameter objects in the list header, move-up operation will be invalid, and the same principle can be applied to the parameter objects in the list footer; after deleting a certain parameter, the parameter objects under it will be moved up automatically.
The items in the parameter list in running state can be added as needed (through the menu of user defined home parameters), and the list can also be edited such as "Move up", "Move down", "Delete from the list", and "Restore default parameters". The edit function is shown in the interface below.

Figure 5-11 List edit diagram 2

The parameters of user defined parameter setting can be added, deleted or adjusted as needed, such as "Move up", "Move down", "Delete from the list", and "Restore default parameters"; the adding function can be set in a certain function code in a function group. The edit function is shown in the figure below.

Figure 5-12 List edit diagram 3

### 5.4.3 Adding parameters to the parameter list displayed in stopped/running state

You can choose Menu > State monitoring, choose a submenu, enter a specific function group and then a specific function code to add the parameter to the list of parameters displayed in stopped state or parameters displayed in running state.

Figure 5-13 Adding parameter diagram 1

After selecting a specific function code, press

key to enter the parameter addition interface, and then press $>$ key, $>$ key or If this parameter is not included in the list of parameters displayed in stopped state or parameters displayed in running state, the parameter added will be at the end of the list; if the parameter is already in the list of parameters displayed in stopped state or parameters displayed in running state, the addition operation will be invalid. If key or key is pressed without any selection in the addition interface, it will return to previous menu.
Part of the monitoring parameters in P07 HMI group can be added to the list of parameters displayed in stopped state or parameters displayed in running state. All the parameters in P17, P18 and P19 group can be added to the list of parameters displayed in stopped state or parameters displayed in running state.

Up to 16 monitoring parameters can be added to the list of parameters displayed in stopped state; and up to 32 monitoring parameters can be added to the list of parameters displayed in running state.

### 5.4.4 Adding parameters to the user defined parameter list

You can choose Menu > Parameter groups, choose a submenu, and enter a specific function group and then a specific function code to add the parameter to the user defined parameter list.

Figure 5-14 Adding parameter diagram 2

Press key to enter addition interface, and press confirm the addition operation. If this parameter is not included in the original user defined parameter list, the newly-added parameter will be at the end of the list; if this parameter is already in the list, the addition operation will be invalid. If key or key is pressed without any selection, it will return to parameter setup list menu.
All the function code groups under the parameter group menu can be added to the user defined parameter list. Up to 64 function codes can be added to the user defined parameter list.

### 5.4.5 Editing user defined parameters

After accessing a specific function code under the User defined parameters menu, you can press key, $>$ key or key to enter parameter selection edit interface. After entering the edit interface, the present value will be highlighted. Press $\boldsymbol{A}$ key and $\boldsymbol{V}$ key to edit the present parameter value, and the corresponding parameter item of the value will be highlighted automatically. After parameter selection is done, press key or key to
save the selected parameter and return to the previous menu. In parameter selection edit interface, press key to maintain the parameter value and return to the previous menu.
Figure 5-15 Editing user defined parameters

In parameter selection edit interface, the "Auth" on the top right indicates whether this parameter is editable or not.
$" \downarrow$ " indicates the set value of this parameter can be modified under current state.
" $\times$ " indicates the set value of this parameter cannot be modified under current state.
"Present" indicates the present value.
"Default" indicates the default value of this parameter.

### 5.4.6 Editing parameters in parameter groups

You can choose Menu > Parameter groups, enter a specific function group and then a specific function code, and then press key, key or key to enter the parameter setting interface. After entering the edit interface, set the parameter from the low bit to high bit, and the bit under setting will be highlighted. Press $\mathbf{A}$ key or $\boldsymbol{V}$ key to increase or decrease the parameter value (this operation is valid until the parameter value exceeds the max. value or min. value); press $\langle$ or $\rangle$ to shift the edit bit. After the parameter is set, press
key or key to save the setting and return to the previous menu; press to maintain the original parameter value and return to the previous menu.

Figure 5-16 Editing parameters in parameter groups

In parameter selection edit interface, the "Auth" on the top right indicates whether this parameter can be modified or not.
$" \checkmark "$ indicates the set value of this parameter can be modified under current state.
" $\times$ " indicates the set value of this parameter cannot be modified under current state.
"Present" indicates the present value.
"Default" indicates the default value of this parameter.

### 5.4.7 Monitoring states

You can choose Menu > State monitoring > State monitoring parameter, enter a specific function group and then a specific function code, and press key, $\square$ key or key to enter the state monitoring interface. After entering the state monitoring interface, the actual parameter value will be displayed in real time; this value is the actually detected value which cannot be modified.

In the state monitoring interface, you can press key or key to return to the previous menu.

Figure 5-17 State monitoring interface

### 5.4.8 Autotuning motor parameters

You can choose Menu > Motor parameter autotune and press
key,
key or
 key to enter motor parameter autotuning interface. However, before entering the motor parameter autotuning interface, you must set the motor nameplate parameters correctly. After entering the interface, select a motor autotuning type to carry out motor parameter autotuning.

In motor parameter autotuning interface, you can press key or key to return to the previous menu.

Figure 5-18 Selecting a parameter autotuning type

After selecting a motor autotuning type, enter motor parameter autotuning interface, and press RUN key to start motor parameter autotuning. After autotuning is done, a message will pop up indicating autotuning is succeeded, and then it will return to the main interface of stop. During autotuning, you can press STOP/RST key to terminate autotuning; if any fault occur during autotuning, the keypad will display a fault interface.

Figure 5-19 Parameter autotuning

| Autotune steps: 3 |  |  |  |
| Parameters autotuned |  |  |  |
|  |  |  |  |
| Back | Home | OK |  |

### 5.4.9 Backing up parameters

You can choose Menu > Copy parameter/Restore default, and press key, key or $\longleftarrow$ key to enter the function parameter backup interface and function parameter restoration interface to upload/download VFD parameters, or restore VFD parameters to default values. The keypad has three different storage areas for parameter backup, and each storage area can save the parameters of one VFD, which means the keypad can save parameters of three VFDs in total.

Figure 5-20 Parameter backup

### 5.4.10 System settings

You can choose Menu > System settings, and press key, key or
 key to enter system setting interface to set the keypad language, time/date, backlight brightness, backlight time and restore parameters.
Note: Clock battery is not included, and the keypad time/date needs to be reset after power off. If time-keeping after power off is needed, you should purchase the clock batteries separately.

Figure 5-21 System setting diagram

### 5.4.11 Power-on setup wizard

The keypad supports the power-on setup wizard function, mainly for the first power-on situation, instructing you to enter the setting menu, and gradually implementing basic functions such as basic parameter setting, direction judgment, mode setting and autotuning.

For first power-on, the keypad automatically enters the setup wizard interface. See the following.

### 5.5 Basic operation instruction

### 5.5.1 What this section contains

This section introduces the function modules inside the VFD

- Ensure all the terminals are fixed and tightened firmly.
- Ensure the motor matches with the VFD power.

### 5.5.2 Common commissioning procedures

The common operation procedures are shown below (take motor 1 as an example).

Note: If fault occurred, rule out the fault cause according to "fault tracking".

The running command channel can be set by terminal commands besides P00.01 and P00.02.

| Current running <br> command <br> channel <br> P00.01 | Multi-function terminal <br> function (36) <br> Command switches to <br> keypad | Multi-function terminal <br> function (37) <br> Command switches to <br> terminal | Multi-function terminal <br> function (38) <br> Command switches to <br> communication |

### 5.5.3 Vector control

Asynchronous motors are featured with high order, non-linear, strong coupling and multi-variables, which makes it very difficult to control asynchronous motors during actual application. The vector control theory aims to solve this problem through measuring and controlling the stator current vector of asynchronous motor, and decomposing the stator current vector into exciting current (current component which generates internal magnet field) and torque current (current component which generates torque) based on field orientation principle, and then controlling the amplitude value and phase position of these two components (namely, control the stator current vector of motor) to realize decoupling control of exciting current and torque current, thus achieving high-performance speed regulation of asynchronous motor.

The GD350 IP55 series VFD carries built-in speed sensor-less vector control algorithm, which can be used to drive the asynchronous motor and permanent-magnet synchronous motor simultaneously. As the core algorithm of vector control is based on accurate motor parameter model, the accuracy of motor parameters will impact the control performance of vector control. It is recommended to input accurate motor parameters and carry out motor parameter autotuning before vector operation.

As vector control algorithm is complicated, users should be cautious of regulation on dedicated function parameters of vector control.

### 5.5.4 SVPWM control mode

The VFD also carries built-in SVPWM control function. SVPWM mode can be used in cases where mediocre control precision is enough. In cases where a VFD needs to drive multiple motors, it is also recommended to adopt SVPWM control mode.

The VFD provides multiple kinds of V/F curve modes to meet different field needs. Users can select corresponding V/F curve or set the V/F curve as needed.

## Suggestions:

1. For the load featuring constant moment, eg, conveyor belt which runs in straight line, as the moment should be constant during the whole running process, it is recommended to adopt straight-type V/F curve.
2. For the load featuring decreasing moment, eg, fan and water pump, as the relation between its actual torque and speed is squared or cubed, it is recommended to adopt the V/F curve corresponds to power 1.3, 1.7 or 2.0.

The VFD also provides multi-point V/F curve. Users can alter the V/F curve outputted by VFD through setting the voltage and frequency of the three points in the middle. The whole curve consists of five points starting from ( $0 \mathrm{~Hz}, \mathrm{OV}$ ) and ending in (fundamental motor frequency, rated motor voltage). During setup, it is required that $0 \leq f 1 \leq f 2 \leq f 3 \leq f u n d a m e n t a l ~ m o t o r ~ f r e q u e n c y, ~$ and $0 \leq \mathrm{V} 1 \leq \mathrm{V} 2 \leq \mathrm{V} 3 \leq$ rated motor voltage

The VFD provides dedicated function codes for SVPWM control mode. Users can improve the performance of SVPWM through settings.

## 1. Torque boost

Torque boost function can effectively compensate for the low-speed torque performance during SVPWM control. Automatic torque boost has been set by default to enable the VFD to adjust the torque boost value based on actual load conditions.

## Note:

(1) Torque boost is effective only under torque boost cut-off frequency;
(2) If the torque boost is too large, low-frequency vibration or overcurrent may occur to the motor, if such situation occurs, lower the torque boost value.

## 2. Energy-saving run

During actual running, the VFD can search for the max. efficiency point to keep running in the most efficient state to save energy.

## Note:

(1) This function is generally used in light load or no-load cases.
(2) This function does for fit in cases where load transient is required.
3. V/F slip compensation gain

SVPWM control belongs to open-loop mode, which will cause motor speed to fluctuate when motor load transients. In cases where strict speed requirement is needed, users can set the slip compensation gain to compensate for the speed variation caused by load fluctuation through internal output adjustment of VFD.
The set range of slip compensation gain is $\mathbf{0 - 2 0 0 \%}$, in which $\mathbf{1 0 0 \%}$ corresponds to rated slip frequency.
Note: Rated slip frequency= (rated synchronous speed of motor-rated speed of motor) $\times$ number of motor pole pairs/60
4. Oscillation control

Motor oscillation often occurs in SVPWM control in large-power drive applications. To solve this problem, the GD350 IP55 series VFD sets two function codes to control the oscillation factor, and users can set the corresponding function code based on the occurrence frequency of oscillation.
Note: The larger the set value, the better the control effect, however, if the set value is too large, it may easily lead to too large VFD output current.
Customized V/F curve (V/F separation) function:

When selecting customized V/F curve function, users can set the reference channels and acceleration/deceleration time of voltage and frequency respectively, which will form a real-time V/F curve through combination.
Note: This kind of V/F curve separation can be applied in various frequency-conversion power sources, however, users should be cautious of parameter setup as improper setup may
damage the machine.

### 5.5.5 Torque control

The VFD supports torque control and speed control. Speed control mode aims to stabilize the speed to keep the set speed consistent with the actual running speed, meanwhile, the max. load-carrying capacity is restricted by torque limit. Torque control mode aims to stabilize the torque to keep the set torque consistent with the actual output torque. Meanwhile, the output frequency is restricted by upper/lower limit.

### 5.5.6 Motor parameter

| 4 | Check the safety conditions surrounding the motor and load machineries before <br> autotuning as physical injury may occur due to sudden start of motor during <br> autotuning. <br> Although the motor does not run during static autotuning, the motor is stilled <br> supplied with power, do not touch the motor during autotuning; otherwise, electric <br> shock may occur. |
| :---: | :--- |
| !If the motor has been connected to load, do not carry out rotary autotuning; otherwise, <br> misact or damage may occur to the VFD. If rotary autotuning is carried out on a motor <br> which has been connected to load, wrong motor parameters and motor misacts may <br> occur. Disconnect the load to carry out autotuning if necessary. |  |

The GD350 IP55 series VFD can drive asynchronous motors and synchronous motors, and it supports two sets of motor parameters, which can be switched over by multi-function digital input terminals or communication modes.

The control performance of the VFD is based on accurate motor model, therefore, users need to carry out motor parameter autotuning before running the motor for the first time (take motor 1 as an example)

## Note:

1. Motor parameters must be set correctly according to motor nameplate;
2. If rotary autotuning is selected during motor autotuning, it is a must to disconnect the motor from load to put the motor in static and no-load state, failed to do so may lead to inaccurate autotuned results. At this time, the asynchronous motor can autotune P02.06-P02.10, and synchronous motor can autotune P02.20-P02.23
3. If static autotuning is selected during motor autotuning, there is no need to disconnect the motor from load, as only part of the motor parameters have been autotuned, the control performance may be impacted, under such situation, the asynchronous motor can autotune P02.06-P02.10, while synchronous motor can autotune P02.20-P02.22, P02.23 (counter-emf constant of synchronous motor 1) can be obtained via calculation.
4. Motor autotuning can be carried out on current motor only, if users need to perform autotuning on the other motor, switch over the motor through selecting the switch-over channel of motor 1 and motor 2 by setting the ones of P08.31.

### 5.5.7 Start/stop control

The start/stop control of the VFD is divided into three states: start after running command at power-up; start after restart-at-power-cut function is effective; start after automatic fault reset. Descriptions for these three start/stop control states are presented below.
There are three start modes for the VFD, which are start at starting frequency, start after DC brake, and start after speed-tracking. Users can select the proper start mode based on field conditions.
For large-inertia load, especially in cases where reversal may occur, users can choose to start after DC brake or start after speed-racking.

Note: It is recommended to drive synchronous motors in direct start mode.

1. Logic diagram for running command after power-up

2. Logic diagram for restart after power-cut

3. Logic diagram for restart after automatic fault reset

### 5.5.8 Frequency setup

The VFD supports multiple kinds of frequency reference modes, which can be categorized into two types: main reference channel and auxiliary reference channel.

There are two main reference channels, namely frequency reference channel A and frequency reference channel $B$. These two channels support simple arithmetical operation between each other, and they can be switched dynamically by setting multi-function terminals.

There is one input mode for auxiliary reference channel, namely terminal UP/DOWN switch input. By setting function codes, users can enable the corresponding reference mode and the impact made on the VFD frequency reference by this reference mode.

The actual reference of VFD is comprised of the main reference channel and auxiliary reference channel.

The VFD supports switch-over between different reference channels, and the rules for channel switch-over are shown below.

| Present reference <br> channel <br> P00.09 | Multi-function terminal <br> function 13 <br> Channel A switches to <br> channel B | Multi-function terminal <br> function $\mathbf{1 4}$ <br> Combination setup <br> switches to channel A | Multi-function terminal <br> function $\mathbf{1 5}$ <br> Combination setup <br> switches to channel B |
| :---: | :---: | :---: | :---: |
| A | B | $/$ | $/$ |
| B | A | $/$ | $/$ |
| A+B | $/$ | A | B |
| A-B | $/$ | A | B |
| $\operatorname{Max~(A,~B)~}$ | $/$ | A | B |
| $\operatorname{Min}($ A, B $)$ | $/$ | A | B |

Note: "/" indicates this multi-function terminal is invalid under present reference channel.
When setting the auxiliary frequency inside the VFD via multi-function terminal UP (10) and DOWN (11), users can increase/decrease the frequency quickly by setting P08.45 (UP terminal frequency incremental change rate) and P08.46 (DOWN terminal frequency decremental change rate).

### 5.5.9 Analog input

GD350 IP55 series VFD carries two analog input terminals (Al1 is $0-10 \mathrm{~V} / 0-20 \mathrm{~mA}$ (voltage input or current input can be set by P05.50); Al2 is $-10-10 \mathrm{~V}$ ) and two high-speed pulse input terminals. Each input can be filtered separately, and the corresponding reference curve can be set by adjusting the reference corresponds to the max. value and min. value.

### 5.5.10 Analog output

The VFD carries one analog output terminal ( $0-10 \mathrm{~V} / 0-20 \mathrm{~mA}$ ) and one high-speed pulse output terminal. Analog output signals can be filtered separately, and the proportional relation can be adjusted by setting the max. value, min. value, and the percentage of their corresponding output. Analog output signal can output motor speed, output frequency, output current, motor torque and motor power at a certain proportion.

AO output relationship description:
(The min. value and max. value of the output correspond to $0 . \%$ and $100.00 \%$ of the pulse or analog default output. The actual output voltage or pulse frequency corresponds to the actual percentage, which can be through function codes.

| Setting | Function | Description |
| :---: | :---: | :--- |
| 0 | Running frequency | $0-$ Max. output frequency |
| 1 | Set frequency | $0-$ Max. output frequency |
| 2 | Ramps reference frequency | $0-$ Max. output frequency |
| 3 | Running speed | 0-Synchronous speed corresponding <br> to max. output frequency |
| 4 | Output current (relative to VFD) | $0-$ Twice the rated current of VFD |
| 5 | Output current (relative to motor) | $0-$ Twice the rated current of motor |
| 6 | Output voltage | $0-1.5$ times of rated voltage of VFD |
| 7 | Output power | $0-$ Twice the rated power of motor |

| Setting | Function | Description |
| :---: | :---: | :---: |
| 8 | Set torque value | 0 -Twice the motor rated current. A negative value corresponds to $0.0 \%$ by default. |
| 9 | Output torque | $0-+/$ (Twice the motor rated torque) |
| 10 | Al1 input value | 0-10V/0-20mA |
| 11 | Al2 input value | $0 \mathrm{~V}-10 \mathrm{~V}$. A negative value corresponds to $0.0 \%$ by default. |
| 12 | Al3 input value | 0-10V/0-20mA |
| 13 | Input value of high-speed pulse HDIA | $0.00-50.00 \mathrm{kHz}$ |
| 14 | Value 1 set through Modbus/Modbus TCP communication | 0-1000 |
| 15 | Value 2 set through Modbus/Modbus TCP communication | 0-1000 |
| 16 | Value 1 set through PROFIBUS/CANopen/DeviceNet communication | 0-1000 |
| 17 | Value 2 set through PROFIBUS/CANopen/DeviceNet communication | 0-1000 |

### 5.5.11 Digital input

The GD350 IP55 series VFD carries four programmable digital input terminals and two HDI input terminals. The function of all the digital input terminals can be programmed by function codes. HDI input terminal can be set to act as high-speed pulse input terminal or common digital input terminal; if it is set to act as high-speed pulse input terminal, users can also set HDIA or HDIB high-speed pulse input to serve as the frequency reference and encoder signal input.

This parameter is used to set the corresponding function of digital multi-function input terminals.

Note: Two different multi-function input terminals cannot be set to the same function.

| Set <br> value | Function | Description |
| :---: | :---: | :--- |
| 0 | No function | The VFD does not act even if there is signal input; users <br> can set the unused terminals to "no function" to avoid <br> misacts. |
| 1 | Forward running (FWD) | Control the forward/reverse running of the VFD by <br> external terminals. |
| 2 | Reverse running (REV) | Set the VFD running mode to the 3-wire control mode by <br> this terminal. See P05.13 for details. |
| 3 | 3-wire control | Frequency when jogging, see P08.06, P08.07 and P08.08 <br> for jogging acceleration/deceleration time. |
| 4 | Forward jogging | The VFD blocks output, and the stop process of motor is <br> uncontrolled by the VFD. This mode is applied in cases of <br> large-inertia load and free stop time; its definition is the <br> same with P01.08, and it is mainly used in remote control. |
| 5 | Reverse jogging | Coast to stop |

| Set <br> value | Function | Description |  |  |  |  |  |  |
| :---: | :---: | :--- | :--- | :---: | :---: | :---: | :---: | :---: |
| 7 | Fault reset | External fault reset function, its function is the same with <br> the STOP/RST key on the keypad. This function can be <br> used in remote fault reset. |  |  |  |  |  |  |
| 8 | Running pause | The VFD decelerates to stop, however, all the running <br> parameters are in memory state, eg PLC parameter, <br> wobbling frequency, and PID parameter. After this signal <br> disappears, the VFD will revert to the state before stop. |  |  |  |  |  |  |
| 9 | External fault input | When external fault signal is transmitted to the VFD, the <br> VFD releases fault alarm and stops. |  |  |  |  |  |  |
| 10 | Frequency increase (UP) | Used to change the frequency-increase/decrease <br> command when the frequency is given by external |  |  |  |  |  |  |
| 11 | Frequency decrease (DOWN) |  |  |  |  |  |  |  |
| terminals. |  |  |  |  |  |  |  |  |

| Set value | Function | Description |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 21 | Acceleration/deceleration time selection 1 | Use these two terminals to select four groups of acceleration/decoration time. |  |  |  |
|  |  | Terminal | Terminal <br> 2 | Acceleration or deceleration time selection | Corresponding parameter |
|  |  | OFF | OFF | Acceleration/ deceleration time 1 | P00.11/P00.12 |
|  |  | ON | OFF | Acceleration/ deceleration time 2 | P08.00/P08.01 |
|  |  | OFF | ON | Acceleration/ deceleration time 3 | P08.02/P08.03 |
| 22 | Acceleration/deceleration <br> time selection 2 | ON | ON | Acceleration/ deceleration time 4 | P08.04/P08.05 |
| 23 | Simple PLC stop reset | Restart simple PLC process and clear previous PLC state information. |  |  |  |
| 24 | Simple PLC pause | The program pauses during PLC execution, and keeps running in current speed step. After this function is cancelled, simple PLC keeps running. |  |  |  |
| 25 | PID control pause | PID is ineffective temporarily, and the VFD maintains current frequency output. |  |  |  |
| 26 | Wobbling frequency pause (stop at current frequency) | The VFD pauses at current output. After this function is canceled, it continues wobbling-frequency operation at current frequency. |  |  |  |
| 27 | Wobbling frequency reset (revert to center frequency) | The set frequency of VFD reverts to center frequency. |  |  |  |
| 28 | Counter reset | Zero out the counter state. |  |  |  |
| 29 | Switching between speed control and torque control | The VFD switches from torque control mode to speed control mode, or vice versa. |  |  |  |
| 30 | Acceleration/deceleration disabled | Ensure the VFD will not be impacted by external signals (except for stop command), and maintains current output frequency. |  |  |  |
| 31 | Counter trigger | Enable pulse counting of the counter. |  |  |  |
| 33 | Clear frequency increase/decrease setting temporarily | When the terminal is closed, the frequency value set by UP/DOWN can be cleared to restore the reference frequency to the frequency given by frequency command channel; when terminal is disconnected, it will revert to the frequency value after frequency increase/decrease setting. |  |  |  |
| 34 | DC brake | The VFD starts DC brake immediately after the command becomes valid. |  |  |  |
| 35 | Switching between motor 1 and motor 2 | When this terminal is valid, users can realize switch-over control of two motors. |  |  |  |
| 36 | Command switches to keypad | When this terminal is valid, the running command channel will switch to keypad compulsorily. If this function becomes invalid, the running command channel will revert to the original state. |  |  |  |

| Set value | Function | Description |
| :---: | :---: | :---: |
| 37 | Command switches to terminal | When this terminal is valid, the running command channel will switch to terminal compulsorily. If this function becomes invalid, the running command channel will revert to the original state. |
| 38 | Command switches to communication | When this terminal is valid, the running command channel will switch to communication compulsorily. If this function becomes invalid, the running command channel will revert to the original state. |
| 39 | Pre-exciting command | When this terminal is valid, motor pre-exciting will be started until this terminal becomes invalid. |
| 40 | Zero out power consumption quantity | After this command becomes valid, the power consumption quantity of the VFD will be zeroed out. |
| 41 | Maintain power consumption quantity | When this command is valid, current operation of the VFD will not impact the power consumption quantity. |
| 42 | Source of upper torque limit switches to keypad | When this command is valid, the upper limit of the torque will be set by keypad |
| 43 | Position reference point input | Valid only for S1, S2, and S3. |
| 44 | Disable spindle orientation | Spindle orientation is invalid. |
| 45 | Spindle zeroing/local position zeroing | Spindle positioning is triggered. |
| 46 | Spindle zero position selection 1 | Spindle zero position selection 1. |
| 47 | Spindle zero position selection 2 | Spindle zero position selection 2. |
| 48 | Spindle scale division selection 1 | Spindle scale division selection 1. |
| 49 | Spindle scale division selection 2 | Spindle scale division selection 2. |
| 50 | Spindle scale division selection 3 | Spindle scale division selection 3. |
| 51 | Position/speed control switchover terminal | Terminal for switching between position control and speed control. |
| 52 | Disable pulse input | Pulse input is invalid when the terminal is valid. |
| 53 | Clear position deviation | Used to clear the input deviation of position loop. |
| 54 | Switch position proportional gains | Used to switch position proportional gains. |
| 55 | Enable cyclic digital positioning | Cyclic positioning can be enabled when digital positioning is valid. |
| 56 | Emergency stop | When this command is valid, the motor decelerate to emergency stop as per the time set by P01.26. |
| 57 | Motor over-temperature fault input | Motor stops at motor over-temperature fault input. |
| 59 | FVC switches to V/F control | When this terminal is valid in stop state, switch to SVPWM control. |

| Set value | Function | Description |
| :---: | :---: | :---: |
| 60 | Switch to FVC control | When this terminal is valid in stop state, switch to closed-loop vector control. |
| 61 | PID polarity switch-over | Switching the output polarity of PID, this terminal should be used in conjunction with P09.03 |
| 66 | Zero out the counter | Zero out the position counting value |
| 67 | Pulse increase | When the terminal function is valid, the pulse input is increased according to the P21.27 pulse speed. |
| 68 | Enable pulse superimposition | When the pulse superimposition is enabled, pulse increase and pulse decrease are effective. |
| 69 | Pulse decrease | When the terminal function is valid, the pulse input is decreased according to the P21.27 pulse speed. |
| 70 | Electronic gear selection | When the terminal is valid, the proportional numerator is switched to the P21.30 numerator of the $2^{\text {nd }}$ command ratio. |
| 71 | Switch to mater | In stopped state, if the function is valid, the master is used. |
| 72 | Switch to slave | In stopped state, if the function is valid, the slave is used. |
| 73 | Reset roll diameter | Used to reset the roll diameter when the tension control function is enabled. |
| 74 | Switch winding/unwinding | Used to switch winding/unwinding modes when the tension control function is enabled. |
| 75 | Tension control pre-drive | If the terminal is valid when the tension control function is enabled, tension control pre-drive is performed. |
| 76 | Disable roll diameter calculation | If the terminal is valid when the tension control function is enabled, roll diameter calculation is disabled. |
| 77 | Clear alarm display | Used to clear the alarm display when the tension control function is enabled. |
| 78 | Manual braking of tension control | If the terminal is valid when the tension control function is enabled, manual braking is activated. |
| 79 | Trigger forced feeding interrupt | If the terminal is valid when the tension control function is enabled, a feeding interrupt signal is triggered forcibly. |
| 80 | Initial roll diameter 1 | Used to select different initial roll diameters by combining with the initial roll diameter 2 when the tension control function is enabled. |
| 81 | Initial roll diameter 2 | Used to select different initial roll diameters by combining with the initial roll diameter 1 when the tension control function is enabled. |
| 82 | Trigger fire mode control | In fire mode, if the terminal is valid, the fire mode control signal is triggered. |
| 83 | Switch tension PID parameters | Used to switch two PID parameter groups when the tension control function is enabled. The first group is used by default. If the terminal is valid, the second group is used. |
| 84-95 | Reserved | , |

### 5.5.12 Digital output

The GD350 IP55 series VFD carries two groups of relay output terminals, one open collector Y output terminal and one high-speed pulse output (HDO) terminal. The function of all the digital output terminals can be programmed by function codes, of which the high-speed pulse output terminal HDO can also be set to high-speed pulse output or digital output by function code.

The table below lists the options for the above four function parameters, and users are allowed to select the same output terminal functions repetitively.

| Set <br> value | Function | Description |
| :---: | :---: | :--- |
| 0 | Invalid | Output terminal has no function |
| 1 | In running | Output ON signal when there is frequency <br> output during running |
| 2 | Output ON signal when there is frequency <br> output during forward running |  |
| 3 | In reverse running running | Output ON signal when there is frequency <br> output during reverse running |
| 4 | Output ON signal when there is frequency <br> output during jogging |  |
| 5 | VFD fault | Output ON signal when VFD fault occurred |
| 6 | Frequency level detection FDT1 | Refer to P08.32 and P08.33 |
| 7 | Frequency level detection FDT2 | Refer to P08.34 and P08.35 |
| 8 | Frequency reached | Refer to P08.36 <br> 9$\quad$Output ON signal when the VFD output <br> frequency and reference frequency are both <br> zero. |
| 10 | Reach upper limit frequency | Output ON signal when the running frequency <br> reaches upper limit frequency |
| 11 | Reach lower limit frequency | Output ON signal when the running frequency <br> reached lower limit frequency |
| 12 | Ready to run | Main circuit and control circuit powers are <br> established, the protection functions do not act; <br> when the VFD is ready to run, output ON signal |
| 13 | In pre-exciting | Output ON signal during pre-exciting of the VFD |
| 14 | Output ON signal after the pre-alarm time |  |
| elapsed based on the pre-alarm threshold; see |  |  |
| P11.08-P11.10 for details. |  |  |

| Set value | Function | Description |
| :---: | :---: | :---: |
| 16 | Simple PLC state completed | Output signal when current stage of simple PLC is completed |
| 17 | Simple PLC cycle completed | Output signal when a single cycle of simple PLC operation is completed |
| 23 | Virtual terminal output of Modbus/Modbus TCP communication | Output corresponding signal based on the set value of Modbus/Modbus TCP; output ON signal when it is set to 1 , output OFF signal when it is set to 0 |
| 24 | Virtual terminal output of POROFIBUS/CANopen communication | Output corresponding signal based on the set value of PROFIBUS/CANopen; output ON signal when it is set to 1 , output OFF signal when it is set to 0 |
| 25 | Virtual terminal output of Ethernet communication | Output corresponding signal based on the set value of Ethernet; output ON signal when it is set to 1 , output OFF signal when it is set to 0 . |
| 26 | DC bus voltage established | Output is valid when the bus voltage is above the undervoltage threshold of the inverter. |
| 27 | Z pulse output | Output is valid when the encoder Z pulse is arrived, and is invalid after 10 ms . |
| 28 | During pulse superposition | Output is valid when the pulse superposition terminal input function is valid |
| 29 | STO action | Output when STO fault occurred |
| 30 | Positioning completed | Output is valid when position control positioning is completed |
| 31 | Spindle zeroing completed | Output is valid when spindle zeroing is completed |
| 32 | Spindle scale-division completed | Output is valid when spindle scale-division is completed |
| 33 | Speed limit reached during torque control | Output is valid when the frequency is limited |
| 34 | Virtual terminal output of EtherCAT/PROFITNET/Ethernet IP communication | The corresponding signal is output according to the set value of PROFINET communication. When it is set to 1 , the ON signal is output, and when it is set to 0 , the OFF signal is output. |
| 35 | Reserved |  |
| 36 | Speed/position control switch-over completed | Output is valid when the mode switch-over is completed |
| 37 | Any frequency reached | The frequency reached signal is output when the present ramp reference frequency is greater than the detection value for frequency being reached. |
| 38-40 | Reserved |  |
| 41 | Y1 | Y1 from the programmable card |

### 5.5.13 Simple PLC

Simple PLC is a multi-step speed generator, and the VFD can change the running frequency and direction automatically based on the running time to fulfill process requirements. Previously, such function was realized with external PLC, while now, the VFD itself can achieve this function.

The GD350 IP55 series VFD can realize 16-step speeds control, and provide four groups of acceleration/deceleration time for users to choose from.

After the set PLC completes one cycle (or one section), one ON signal can be output by the multi-function relay.

### 5.5.15 PID control

PID control, a common mode for process control, is mainly used to adjust the VFD output frequency or output voltage by performing scale-division, integral and differential operations on the difference between feedback signal of controlled variables and signal of the target, thus forming a negative feedback system to keep the controlled variables above the target. It is applicable to flow control, pressure control, temperature control, and so on. The following is the basic schematic block diagram for output frequency regulation.

Introduction to the working principles and control methods for PID control

## Proportional control ( Kp ):

When the feedback is different from the reference, the output will be proportional to the difference. If such a difference is constant, the regulating variable will also be constant. Proportional control can respond to feedback changes rapidly, however, it cannot eliminate the difference by itself. A larger the proportional gain indicates a faster regulating speed, but a too large gain will result in oscillation. To solve this problem, set the integral time to a large value and the differential time to 0 , run the system only with proportional control, and then change the reference to observe the difference (that is, static difference) between the feedback signal and reference. If the static difference occurs in the direction of reference change (such as reference increase, where the feedback is always less than the reference after system stabilizes), continue increasing the proportional gain; otherwise, decrease the proportional
gain. Repeat this process until the static difference becomes small.

## Integral time (Ti):

When feedback deviates from reference, the output regulating variable accumulates continuously, if the deviation persists, the regulating variable will increase continuously until deviation disappears. Integral regulator can be used to eliminate static difference; however, too large regulation may lead to repetitive overshoot, which will cause system instability and oscillation. The feature of oscillation caused by strong integral effect is that the feedback signal fluctuates up and down based on the reference variable, and fluctuation range increases gradually until oscillation occurred. Integral time parameter is generally regulated gradually from large to small until the stabilized system speed fulfills the requirement.

## Derivative time (Td):

When the deviation between feedback and reference changes, output the regulating variable which is proportional to the deviation variation rate, and this regulating variable is only related to the direction and magnitude of the deviation variation rather than the direction and magnitude of the deviation itself. Differential control is used to control the feedback signal variation based on the variation trend. Differential regulator should be used with caution as it may easily enlarge the system interferences, especially those with high variation frequency.
When frequency command selection (P00.06, P00. 07) is 7, or channel of voltage setup (P04.27) is 6, the running mode of VFD is process PID control.

### 5.5.15.1 General procedures for PID parameter setup

a. Determining proportional gain $P$

When determining proportional gain P , first, remove the integral term and derivative term of PID by making $\mathrm{Ti}=0$ and $\mathrm{Td}=0$ (see PID parameter setup for details), thus turning PID into pure proportional control. Set the input to $60 \%-70 \%$ of the max. allowable value, and increase proportional gain P gradually from 0 until system oscillation occurred, and then in turn, decrease proportional gain P gradually from current value until system oscillation disappears, record the proportional gain $P$ at this point and set the proportional gain P of PID to 60\%-70\% of current value. This is whole commissioning process of proportional gain $P$.
b. Determine integral time Ti

After proportional gain P is determined, set the initial value of a larger integral time Ti , and decrease Ti gradually until system oscillation occurred, and then in turn, increase Ti until system oscillation disappears, record the Ti at this point, and set the integral time constant Ti of PID to $150 \%-180 \%$ of current value. This is the commissioning process of integral time constant Ti.
c. Determining derivative time Td

The derivative time Td is generally set to 0 .
If users need to set Td to another value, set in the same way with P and Ti, namely set Td to $30 \%$ of the value when there is no oscillation.
d. Empty system load, perform load-carrying joint debugging, and then fine-tune PID parameter until fulfilling the requirement.

### 5.5.15.2 How to fine-tune PID

After setting the parameters controlled by PID, users can fine-tune these parameters by the following means.

Control overmodulation: When overmodulation occurred, shorten the derivative time (Td) and prolong integral time (Ti).

Stabilize the feedback value as fast as possible: when overmodulation occurred, shorten integral time (Ti) and prolong derivative time (Td) to stabilize control as fast as possible.

Control long-term vibration: If the cycle of periodic vibration is longer than the set value of integral time ( Ti ), it indicates the integral action is too strong, prolong the integral time ( Ti ) to control vibration.

Control short-term vibration: If the vibration cycle is short is almost the same with the set value of derivative time ( Td ), it indicates derivative action is too strong, shorten the derivative time (Td) to control vibration. When derivative time (Td) is set to 0.00 (namely no derivative control), and there is no way to control vibration, decrease the proportional gain.

Related parameter list:

| P00.12 | Deceleration time 1 | 0.0-3600.0s | Model depended |
| $\begin{aligned} & \text { P05.01- } \\ & \text { P05.06 } \end{aligned}$ | Digital input function selection | 26: Wobbling frequency pause (stop at current frequency) <br> 27: Wobbling frequency reset (revert to center frequency) | , |
| P08.15 | Amplitude of wobbling frequency | 0.0-100.0\% (relative to set frequency) | 0.0\% |
| P08.16 | Amplitude of jump frequency | $0.0-50.0 \%$ (relative to amplitude of wobbling frequency) | 0.0\% |
| P08.17 | Wobbling frequency rise time | 0.1-3600.0s | 5.0s |
| P08.18 | Wobbling frequency fall time | 0.1-3600.0s | 5.0s |

### 5.5.17 Local encoder input

The GD350 IP55 series VFD supports pulse count function by inputting the count pulse from HDI high-speed pulse port. When the actual count value is no less than the set value, digital output terminal will output count-value-reached pulse signal, and the corresponding count value will be zeroed out.

| Function <br> code | Name | Description | Default <br> value |
| :---: | :---: | :--- | :---: |
| P05.00 | HDI input type | 0x00-0x11 <br> Ones: HDIA input type <br> 0: HDIA is high-speed pulse input <br> $1:$ HDIA is digital input <br> Tens: HDIB input type <br> 0: HDIB is high-speed pulse input <br> $1:$ HDIB is digital input | $0 \times 00$ |
| P05.38 | HDIA high-speed pulse input <br> function | 0: Set input via frequency <br> $1:$ Reserved <br> 2: Input via encoder, used in combination <br> with HDIB | 0 |

| Function <br> code | Name | Description | Default <br> value |
| :---: | :--- | :--- | :---: |
| P05.44 | HDIB high-speed pulse input <br> function selection | 0: Set input via frequency <br> $1:$ Reserved <br> 2: Input via encoder, used in combination <br> with HDIA | 0 |
| P20.15 | Speed measurement mode | 0: PG card <br> $1:$ local; realized by HDIA and HDIB; <br> supports incremental 24V encoder only | 0 |
| P18.00 | Actual frequency of encoder | $-999.9-3276.7 \mathrm{~Hz}$ | 0.0 Hz |

### 5.5.18 Commissioning procedures for closed-loop control, position control and spindle positioning

1. Commissioning procedures for closed-loop vector control of asynchronous motor

Step 1: Restore to default value via keypad
Step 2: Set P00.03, P00.04 and P02 group motor nameplate parameters
Step 3: Motor parameter autotuning
Carry out rotary parameter autotuning or static parameter autotuning via keypad, if the motor can be disconnected from load, then it is users can carry out rotary parameter autotuning; otherwise, carry out static parameter autotuning, the parameter obtained from autotuning will be saved in P02 motor parameter group automatically.

Step 4: Verify whether the encoder is installed and set properly
a) Confirm the encoder direction and parameter setup

Set P20.01 (encoder pulse-per-revolution), set $P 00.00=2$ and $P 00.10=20.00 \mathrm{~Hz}$, and run the VFD, at this point, the motor rotates at 20 Hz , observe whether the speed measurement value of P18.00 is correct, if the value is negative, it indicates the encoder direction is reversed, under such situation, set P20.02 to 1; if the speed measurement value deviates greatly, it indicates P20.01 is set improperly. Observe whether P18.02 (encoder Z pulse count value) fluctuates, if yes, it indicates the encoder suffers interference or P20.01 is set improperly, requiring users to check the wiring and the shielding layer.
b) Determine $Z$ pulse direction

Set $\mathrm{P} 00.10=20.00 \mathrm{~Hz}$, and set P00.13 (running direction) to forward and reverse direction respectively to observe whether the difference value of P18.02 is less than 5 , if the difference value remains to be larger than 5 after setting $Z$ pulse reversal function of P20.02, power off and exchange phase $A$ and phase $B$ of the encoder, and then observe the difference between the value of P18.02 during forward and reverse rotation. Z pulse direction only affects the forward/reverse positioning precision of the spindle positioning carried out with $Z$ pulse.

Step 5: Closed-loop vector pilot-run
Set P00.00=3, and carry out closed-loop vector control, adjust P00.10 and speed loop and current loop PI parameter in P03 group to make it run stably in the whole range.

Step 6: Flux-weakening control
Set flux-weakening regulator gain P03.26=0-8000, and observe the flux-weakening control
effect. P03.22-P03.24 can be adjusted as needed.
2. Commissioning procedures for closed-loop vector control of synchronous motor

Step 1: Set P00.18=1, restore to default value
Step 2: Set P00.00=3 (VC), set P00.03, P00.04, and motor nameplate parameters in P02 group.
Step 3: Set P20.01 encoder parameters
When the encoder is resolver-type encoder, set the encoder pulse count value to (resolver pole pair number $\times 1024$ ), eg, if pole pair number is 4 , set P20.01 to 4096 .
Step 4: Ensure the encoder is installed and set correctly
When motor stops, observe whether P18.21 (resolver angle) fluctuates, if it fluctuates sharply, check the wiring and grounding. Rotates the motor slowly, observe whether P18.21 changes accordingly, if yes, it indicates motor is connected correctly; if the value of P18.02 keeps constant at a non-zero value after rotating for multiple circles, it indicates encoder $Z$ signal is correct.
Step 5: Autotuning of initial position of magnetic pole
Set P20.11=2 or 3 (3: rotary autotuning; 2: static autotuning), press RUN key to run the VFD.
a) Rotary autotuning (P20.11 = 3)

Detect the position of current magnetic pole when autotuning starts, and then accelerates to 10 Hz , autotuning corresponding magnetic pole position of encoder $Z$ pulse, and decelerate to stop.
During running, if ENC1o or ENC1d fault occurred, set P20.02=1 and carry out autotuning again.
After autotuning is done, the angle obtained from autotuning will be saved in P20.09 and P20.10 automatically.
b) Static autotuning

In cases where the load can be disconnected, it is recommended to adopt rotary autotuning (P20.11=3) as it has high angle precision. If the load cannot be disconnected, users can adopt static autotuning (P20.11=2). The magnetic pole position obtained from autotuning will be saved in P20.09 and P20.10.
Step 6: Closed-loop vector pilot-run
Adjust P00.10 and speed loop and current loop PI parameter in P03 group to make it run stably in the whole range. If oscillation occurred, reduce the value of P03.00, P03.03, P03.09 and P03.10. If current oscillation noise occurred during low speed, adjust P20.05.

Note: It is necessary to re-determine P20.02 (encoder direction) and carry out magnetic pole position autotuning again if the wiring of motor or encoder is changed.
3. Commissioning procedures for pulse train control

Pulse input is operated based on closed-loop vector control; speed detection is needed in the subsequent spindle positioning, zeroing operation and division operation.
Step 1: Restore to default value by keypad
Step 2: Set P00.03, P00.04 and motor nameplate parameters in P02 group

Step 3: Motor parameter autotuning: rotary parameter autotuning or static parameter autotuning

Step 4: Verity the installation and settings of encoder. Set P00.00=3 and P00.10=20.00Hz to run the system, and check the control effect and performance of the system.
Step 5: Set P21.00=0001 to set positioning mode to position control, namely pulse-string control. There are four kinds of pulse command modes, which can be set by P21.01 (pulse command mode).
Under position control mode, users can check high bit and low bit of position reference and feedback, P18.02 (count value of Z pulse), P18.00 (actual frequency of encoder), P18.17 (pulse command frequency) and P18.19 (position regulator output) via P18, through which users can figure out the relation between P18.8 (position of position reference point) and P18.02, pulse command frequency P18.17, pulse command feedforward P18.18 and position regulator output P18.19.
Step 6: The position regulator has two gains, namely P21.02 and P21.03, and they can be switched by speed command, torque command and terminals.
Step 7: When P21.08 (output limit of position controller) is set to 0 , the position control will be invalid, and at this point, the pulse train acts as frequency source, P21.13 (position feedforward gain) should be set to $100 \%$, and the speed acceleration/deceleration time is determined by the acceleration /deceleration time of pulse train, the pulse train acceleration/deceleration time of the system can be adjusted. If the pulse train acts as the frequency source in speed control, users can also set P21.00 to 0000, and set the frequency source reference P 00.06 or P 00.07 to 12 (set by pulse train AB ), at this point, the acceleration/deceleration time is determined by the acceleration/deceleration time of the VFD, meanwhile, the parameters of pulse train AB is still set by P21 group. In speed mode, the filter time of pulse train $A B$ is determined by P 21.29 .
Step 8: The input frequency of pulse train is the same with the feedback frequency of encoder pulse, the relation between them can be changed by altering P21.11 (numerator of position command ratio) and P21.12 (denominator of position command ratio)
Step 9: When running command or servo enabling is valid (by setting P21.00 or terminal function 63), it will enter pulse train servo running mode.
4. Commissioning procedures for spindle positioning

Spindle orientation is to realize orientation functions like zeroing and division based on closed-loop vector control

Step 1-4: These four steps are the same with the first four steps of the commissioning procedures for closed-loop vector control, which aim to fulfill the control requirements of closed-loop vector control, thus realizing spindle positioning function in either position control or speed control mode.
Step 5: Set P22.00.bit0=1 to enable spindle positioning, set P22.00.bit1 to select spindle zero input. If the system adopts encoder for speed measurement, set P22.00.bit1 to 0 to select Z pulse input; if the system adopts photoelectric switch for speed measurement, set P22.00.bit1 to 1 to select photoelectric switch as zero input; set P22.00.bit2 to select zero search mode, set P22.00.bit3 to enable or disable zero calibration, and select zero calibration mode by setting P22.00.bit7.

Step 6: Spindle zeroing operation
a) Select the positioning direction by setting P22.00.bit4;
b) There are four zero positions in P22 group, users can choose one out of four zeroing positions by setting zeroing input terminal selection $(46,47)$ in P05 group. When executing zeroing function, the motor will stop accurately at corresponding zeroing position according to the set positioning direction, which can be viewed via P18.10;
c) The positioning length of spindle zeroing is determined by the deceleration time of accurate-stop and the speed of accurate-stop;
Step 7: Spindle division operation
There are seven scale-division positions in P22 group, users can choose one out of seven scale-division positions by setting scale-division input terminal selection (48, 49, 50) in P05 group. Enable corresponding scale-division terminal after the motor stops accurately, and the motor will check the scale-division position state and switch to corresponding position incrementally, at this point, users can check P18.09.

Step 8: Priority level of speed control, position control and zeroing
The priority level of speed running is higher than that of the scale division, when the system runs in scale-division mode, if spindle orientation is prohibited, the motor will turn to speed mode or position mode.
The priority level of zeroing is higher than that of the scale division.
Scale-division command is valid when the scale-division terminal is from 000 state to non-000 state, eg, in 000-011, the spindle executes scale division 3 . The transition time during terminal switch-over needs to be less than 10 ms ; otherwise, wrong scale division command may be executed.
Step 9: Hold positioning
The position loop gain during positioning is P21.03; while the position loop gain in positioning-completion-hold state is P21.02. In order to keep sufficient position-hold force and ensure no system oscillation occurred, adjust P03.00, P03.01, P20.05 and P21.02.
Step 10: Positioning command selection (bit6 of P22.00)
Electric level signal: Positioning command (zeroing and scale division) can be executed only when there is running command or the servo is enabled.
Step 11: Spindle reference point selection (bit0 of P22.00)
Encoder Z pulse positioning supports the following spindle positioning modes:
a) the encoder is installed on the motor shaft, the motor shaft and spindle is $1: 1$ rigid connection;
b) the encoder is installed on the motor shaft, the motor shaft and spindle is $1: 1$ belt connection;
At this point, the belt may slip during high-speed running and cause inaccurate positioning, it is recommended to install proximity switch on the spindle.
c) The encoder is installed on the spindle, and the motor shaft is connected to the spindle with belt, the drive ratio is not necessarily $1: 1$;
At this point, set P20.06 (speed ratio of the mounting shaft between motor and encoder), and set P22.14 (spindle drive ratio) to 1. As the encoder is not installed on the motor, the control performance of closed-loop vector will be affected.
Proximity switch positioning supports the following spindle positioning modes:
a) The encoder is installed on the motor shaft, the drive ratio between motor shaft and spindle is not necessarily $1: 1$;
At this point, it is required to set P22.14 (spindle drive ratio).
5. Commissioning procedures for digital positioning

The diagram for digital positioning is shown below.

Step 1-4: These four steps are the same with the first four steps of the commissioning procedures for closed-loop vector control, which aim to fulfill the control requirements of closed-loop vector control.
Step 5: Set P21.00=0011 to enable digital positioning. Set P21.17, P21.11 and P21.12 (set positioning displacement) according to actual needs; set P21.18 and P21.19 (set positioning speed); set P21.20 and P21.21 (set acceleration/deceleration time of positioning).
Step 6: Single positioning operation
Set P21.16.bit1=0, and the motor will carry out single positioning action and stay in the positioning position according to the setup in step 5.

Step 7: Cyclic positioning operation
Set P21.16.bit1=1 to enable cyclic positioning. The cyclic positioning is divided into continuous mode and repetitive mode; users can also carry out cyclic positioning through terminal function (no. 55, enable digital positioning cycle)
6. Commissioning procedures for positioning of photoelectric switch

Photoelectric switch positioning is to realize positioning function based on closed-loop vector control.

$\square$
 arrival signal

Cyclic positioning enable signal

Positioning completion signal

Step 1-4: These four steps are the same with the first four steps of the commissioning procedures for closed-loop vector control, which aim to fulfill the control requirements of closed-loop vector control.
Step 5: Set P21.00=0021 to enable photoelectric switch positioning, the photoelectric switch signal can be connected to S 8 terminal only, and set $\mathrm{P} 05.08=43$, meanwhile, set P21.17, P21.11 and P21.12 (set positioning displacement) based on actual needs; set P21.21 (deceleration time of positioning), however, when present running speed is too fast or the set positioning displacement is too small, the deceleration time of positioning will be invalid, and it will enter direct deceleration positioning mode.

Step 6: Cyclic positioning
After positioning is done, the motor will stay in current position. Users can set cyclic positioning through input terminal function selection (55: enable cyclic digital positioning) in P05 group; when the terminal receives cyclic positioning enable signal (pulse signal), the motor will continue running in the set speed as per the speed mode and re-enter positioning state after encountering photoelectric switch.
(7) Hold positioning

The position loop gain during positioning is P21.03; while the position loop gain in positioning-completion-hold state is P21.02. In order to keep sufficient position-hold force and ensure no system oscillation occurred, adjust P03.00, P03.01, P20.05 and P21.02.

### 5.5.19 Fault handling

The following provides fault handling information.

Related parameter list:

| Function code | Name | Description | Default value |
| :---: | :---: | :---: | :---: |
| P07.27 | Type of present fault | ```0: No fault 1: Inverter unit U phase protection (OUt1) 2: Inverter unit V phase protection (OUt2) 3: Inverter unit W phase protection (OUt3) 4: Overcurrent during acceleration (OC1) 5: Overcurrent during deceleration (OC2) 6: Overcurrent during constant speed (OC3) 7: Overvoltage during acceleration (OV1) 8: Overvoltage during deceleration (OV2) 9: Overvoltage during constant speed (OV3) 10: Bus undervoltage fault (UV) 11: Motor overload (OL1) 12: VFD overload (OL2) 13: Phase loss on input side (SPI) 14: Phase loss on output side (SPO) 15: Rectifier module overheat (OH1)``` | 0 |
| P07.28 | Type of the last fault |  | 1 |
| P07.29 | Type of the last but one fault |  | 1 |
| P07.30 | Type of the last but two fault |  | 1 |
| P07.31 | Type of the last but three fault |  | , |
| P07.32 | Type of the last but four fault |  |  |

| Function code | Name | Description | Default value |

### 5.5.20 Tension control solutions

In many fields of industrial production, precise tension control is needed to maintain a constant output tension of the drive equipment, in order to improve the quality of the products. In the
winding and unwinding of some industries such as paper processing, printing and dyeing, packing, wire and cable manufacturing, textile, fiber, optic cable, leather, metal foil material processing and so on, tension needs to keep constant.
The VFD controls the tension by regulating the motor output torque or speed. There are three modes to control the tension: speed mode, open-loop torque mode and closed-loop torque mode.

### 5.5.20.1 Typical tension control applications for winding/unwinding

In some special situations, if the roll diameter can be counted through thickness, the following applications can be implemented:

### 5.5.20.2 Speed control

The detection feedback signal is needed in the closed-loop adjustment. PID calculation is carried out according to the feedback signal for the motor speed regulation, linear speed and stable tension control. If the tension rocker or floating roller is used for feedback, changing the set value (PID reference) may change the actual tension, and at the same time, changing the mechanical configuration such as the tension rocker or floating roller weight can also change the tension.

The control principle is as follows.

Related modules:
(1) Linear speed input module: It is important for the calculation of the basic setting frequency according to the linear speed and the calculation of roll diameter according to the linear speed.
(2) Real-time roll diameter calculation module: The calculation accuracy of roll diameter determines the control performance. The roll diameter can be calculated according to the VFD output frequency and the linear speed. In addition, it can also be calculated through the thickness or sensor. The linear speed is widely used for the calculation. If the set linear speed is used for the calculation, you you choose whether to enable the function of roll diameter change limiting.
(3) PID regulation module: There are two groups of PID parameters in P09. The linear speed synchronization and stable tension can be kept through PID regulation. PID parameters can be modified based on site commissioning. The two groups of PID parameters can be switched for PID regulation improvement.
(4) Material feeding interrupt detection and processing module: The function is valid when material feeding interrupt detection has been enabled.
(5) Pre-drive: This function is applied to automatic reel change. After the VFD is started if the pre-drive function terminal is valid, the roller runs at the set linear speed. When the terminal is invalid, the VFD will automatically switch to the corresponding control mode after a period of time.

### 5.5.20.3 Open-loop torque mode

Open loop means there is no tension feedback signal. In this mode, stable tension can be achieved by means of motor torque control. The rotation speed automatically changes with the linear speed of material. The control basis is as follows: For a reel control system, the relationship between the tension F of the roller with materials, present roll diameter D and output torque of the shaft is: $T=F \times D / 2$. If the output torque can be adjusted according to the variation of roll diameter, the tension can be controlled. In order to ensure the constant tension in the process of acceleration and deceleration, the internal friction compensation module and inertia compensation module have been built in the VFD to calculate the real time rotation inertia, and compensate the torque according to the actual speed change rate. The control principle is shown in the following figure.

Relevant modes:
(1) Linear speed input module: It has two functions: calculating the synchronous frequency in torque control according to the linear speed, and calculating the roll diameter according to the linear speed.
(2) Tension setting module: Used to set the tension adapting to the control system. It needs to be adjusted according to the actual situation. After confirmation, the value remains the same. In some scenarios where the forming effect after winding needs to be improved, the tension taper function can be used so that the tension decreases as the roll diamter increases.
(3) Real-time roll diameter calculation module: The calculation accuracy of roll diameter determines the control performance. The roll diameter can be calculated according to the VFD output frequency and the linear speed. In addition, it can also be calculated through the thickness or sensor. The linear speed is widely used for the calculation. If the set linear speed is used for the calculation, you you choose whether to enable the function of roll diameter change limiting.
(4) Torque compensation module: Torque compensation includes friction torque compensation and inertia torque compensation. Friction torque compensation is used to eliminate the impact of friction on tension, and it needs to be adjusted according to actual requirements. rRotation inertia includes inertial of mechanical systems and that of materials. In order to keep the tension stable in ACC/DEC, compensation torque is required. In some cases without strict tension control requirements, disabling rotation inertia torque compensation can also achieve the control.
(5) Material feeding interrupt detection and processing module: The function is valid when material feeding interrupt detection has been enabled.
(6) This function is applied to automatic reel change. After the VFD is started if the pre-drive function terminal is valid, the roller runs at the set linear speed. When the terminal is invalid, the VFD will automatically switch to the corresponding control mode after a period of time.

### 5.5.20.4 Closed-loop torque mode

Similar to the open-loop torque mode, the closed-loop torque mode has only the difference that tension detection sensors are installed on the winding/unwinding side. In addition to all the function modules supported in open-loop torque mode, this mode supports an additional tension feedback PID closed-loop regulation module. The control principle is shown in the following figure.

## 6 Function parameter list

### 6.1 What this chapter contains

This chapter lists all the function codes and corresponding description of each function code.

### 6.2 Function parameter list

Function parameters of the GD350 IP55 series VFD are categorized according to functions. Among the function groups, P98 is analog input/output calibration group, and P99 is factory function group which cannot be accessed by users. The function code adopts three-level menu, eg, "P08.08" indicates it is the no. 8 function code in P8 group.
The function group no. corresponds to the first-level menu; function code no. corresponds to the second-level menu; function code parameter corresponds to the third-level menu.

1. The function list is divided into the following columns:

Column 1 "Function code": number of the function parameter group and the parameter;
Colum 2 "Name": complete name of the function parameter;
Colum 3 "Description": detailed description of this function parameter;
Colum 4 "Default value": The original set value of the function parameter by default;
Colum 5: "Modify": The modification attribute of the function parameter, namely whether the function parameter can be modified and the condition for modification, as shown below.
" O ": the set value of this parameter can be modified when the VFD is in stop or running state;
"○": the set value of this parameter cannot be modified when the VFD is in running state;
"•": the parameter value is the measured value which cannot be modified.
(The VFD has assigned the modification attribute of each parameter automatically to avoid inadvertent modification by users.)
2. "System of numeration for parameters" is decimalism; if the parameter is presented in hexadecimal numbers, the data of each bit will be independent of each other during parameter edit, and the value range of partial bits can be $0-\mathrm{F}$ in hexadecimal system.
3. "Default value" is value restored after parameter refresh during restoring to default value; however, the measured value or recorded value will not be refreshed.
4. In order to enhance parameter protection, the VFD provides password protection for the function codes. After setting user password (namely user password P07.00 is not zero), when users press PRG/ESC key to enter function code edit state, the system will first enter user password verification state which displays "0.0.0.0.0.", requiring operators to input the correct user password. For factory parameters, besides user password, it is also required to input the correct factory password (users should not attempt to modify factory parameters as improper setup may easily lead to mal-operation or damage the VFD). When password protection is unlocked, the user password can be modified at any time; user password is subject to the last input. User password can be cancelled by setting P07.00 to 0; if P01.00 is set to a non-zero value, the parameter will be protected by password. When modifying function parameters through serial communication, the function of user password also follows above rules.

P00-Basic functions

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P00.00 | Speed control mode | 0: SVC 0 <br> 1: SVC 1 <br> 2: SVPWM <br> 3: FVC <br> Note: If 0,1 or 3 is selected, it is required to carry out motor parameter autotuning first. | 2 | $\bigcirc$ |
| P00.01 | Running command channel | 0: Keypad <br> 1: Terminal <br> 2: Communication | 0 | $\bigcirc$ |
| P00.02 | Communicatio <br> n running command channel | 0: Modbus/Modbus TCP <br> 1: PROFIBUS/CANopen/DeviceNet <br> 2: Ethernet <br> 3: EtherCAT/PROFITNET/Ethernet IP <br> 4: PLC programmable card <br> 5: Wireless communication card <br> Note: Modbus TCP, 1, 2, 3, 4 and 5 are extended functions which are applicable with corresponding cards. | 0 | O |
| P00.03 | Max. output frequency | Used to set the max. output frequency of the VFD. It is the basis of frequency setup and the acceleration/deceleration. <br> Setting range: $\operatorname{Max}(\mathrm{P} 00.04,10.00)-630.00 \mathrm{~Hz}$ | 50.00 Hz | $\bigcirc$ |
| P00.04 | Upper limit of running frequency | The upper limit of running frequency is upper limit value of VFD output frequency. This value should be no more than the max. output frequency. When the set frequency is higher than the upper limit frequency, the VFD runs at the upper limit frequency. <br> Setting range: P00.05-P00.03 (max. output frequency) | 50.00 Hz | $\bigcirc$ |
| P00.05 | Lower limit of running frequency | The lower limit of running frequency is the lower limit value of VFD output frequency. <br> When the set frequency is lower than the lower limit frequency, the VFD runs at the lower limit frequency. <br> Note: Max. output frequency $\geq$ upper limit frequency $\geq$ lower limit frequency. <br> Setting range: $0.00 \mathrm{~Hz}-\mathrm{P} 00.04$ (upper limit of running frequency) | 0.00 Hz | $\bigcirc$ |
| P00.06 | A frequency command selection | 0: Keypad 1: Al1 2: Al2 | 0 | $\bigcirc$ |
| P00.07 | B frequency command selection | 3: Al3 <br> 4: High speed pulse HDIA <br> 5: Simple PLC program <br> 6: Multi-step speed running | 15 | O |

| $\begin{gathered} \text { Function } \\ \text { code } \\ \hline \end{gathered}$ | Name | Description | Default value | Modify |

| P00.09 | Combination mode of setting source | $\begin{aligned} & \text { 0: } A \\ & \text { 1: } B \\ & \text { 2: }(A+B) \\ & \text { 3: }(A-B) \\ & \text { 4: Max. (A, B) } \\ & \text { 5: Min. }(A, B) \end{aligned}$ | 0 | $\bigcirc$ |
| P00.10 | Set frequency via keypad | When $A$ and $B$ frequency commands are set by keypad, the value is the initial digital set value of the VFD frequency. <br> Setting range: $0.00 \mathrm{~Hz}-\underline{\text { P00.03 }}$ (max. output frequency) | 50.00 Hz | $\bigcirc$ |
| P00.11 | Acceleration time 1 | Acceleration time is the time needed for accelerating from OHz to max. output frequency (P00.03). | Model depended | $\bigcirc$ |
| P00.12 | Deceleration time 1 | Deceleration time is the time needed from decelerating from max. output frequency (P00.03) to 0 Hz . <br> The Goodrive350 IP55 high-ingress protection series VFD defines four groups of acceleration and deceleration time, which can be selected via multi-function digital input terminals (P05 group). The acceleration/deceleration time of the VFD is the first group by default. <br> Setting range of P00.11 and P00.12: 0.0-3600.0s | Model depended | $\bigcirc$ |
| P00.13 | Running direction | 0 : Run in default direction <br> 1: Run in reverse direction <br> 2: Reverse running is prohibited | 0 | $\bigcirc$ |

| Function <br> code | Name | Description | Default <br> value | Modify |
| :---: | :--- | :--- | :---: | :---: |
|  |  | 3: Static autotuning 2 (partial autotuning) ; when <br> current motor is motor 1, only P02.06, P02.07 and <br> P02.08 will be autotuned; when current motor is <br> motor 2, only P12.06, P12.07 and P12.08 will be <br> autotuned. <br> 4: Rotary autotuning 2, which is similar to rotary <br> autotuning 1 but is only applicable to <br> asynchronous motors. <br> 5: Rotary autotuning 3 (partial autotuning), which <br> is only applicable to asynchronous motors. |  |  |
| P00.16 | AVR function | 0: Invalid <br> 1: Valid during the whole process <br> Automatic voltage regulation function is used to <br> eliminate the impact on the output voltage of VFD <br> when bus voltage fluctuates. | 1 | O |
| P00.17 | VFD model | 0: G model <br> 1: P model | 0: No operation <br> 1: Restore to default value <br> 2: Clear fault records <br> 3: Reserved <br> 4: Reserved <br> 5: Restore default values (for factory test mode) <br> 6: Restore default values (including motor <br> parameters) <br> Note: After the selected function operations are <br> done, this function code will be restored to 0 <br> automatically. Restoration to default value will <br> clear the user password, so this function should be <br> used with caution. The option 5 can be used only <br> for factory testing. | 0 |

## P01-Start/stop control

| Function <br> code | Name | Description | Default <br> value | Modify |
| :---: | :---: | :--- | :---: | :---: |
| P01.00 | Running mode <br> of start | 0: Direct start <br> 1: Start after DC brake <br> 2: Start after speed-tracking | 0 | 0 |
| P01.01 | Starting <br> frequency of <br> direct start | Starting frequency of direct startup is the initial <br> frequency when the VFD starts. See P01.02 (hold <br> time of starting frequency) for details. <br> Setting range: $0.00-50.00 \mathrm{~Hz}$ | 0.50 Hz | 0 |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P01.02 | Hold time of starting frequency |  <br> A proper starting frequency can increase the torque during startup. Within the hold time of starting frequency, the output frequency of VFD is the starting frequency, and then it runs from the starting frequency to the target frequency, if the target frequency (frequency command) is below the starting frequency, the VFD will be standby rather than running. The starting frequency value is unlimited by the lower limit frequency. <br> Setting range: $0.0-50.0 \mathrm{~s}$ | 0.0s | $\bigcirc$ |
| P01.03 | DC brake current before start | During starting, the VFD will first perform DC brake based on the set DC brake current before startup, and then it will accelerate after the set DC brake | 0.0\% | $\bigcirc$ |
| P01.04 | DC brake time before start | time before startup elapses. If the set DC brake time is 0 , DC brake will be invalid. <br> The larger the DC brake current, the stronger the brake force. The DC brake current before startup refers to the percentage relative to rated VFD output current. <br> Setting range of P01.03: 0.0-100.0\% <br> Setting range of P01.04: 0.00-50.00s | 0.00s | $\bigcirc$ |
| P01.05 | Acceleration/d eceleration mode | This function code is used to select the frequency variation mode during starting and running. <br> 0 : Straight line; the output frequency increases or decreases in straight line; <br> 1: $S$ curve; the output frequency increases or decreases in $S$ curve; <br> S curve is generally used in cases where smooth start/stop is required, eg, elevator, conveyer belt, etc. | 0 | $\bigcirc$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  <br> Note: When set to 1 , it is required to set P01.06, P01.07, P01.27 and P01.28 accordingly. |  |  |
| P01.06 | Time of <br> starting <br> section of <br> acceleration S <br> curve | The curvature of S curve is determined by acceleration range and acceleration and deceleration time. <br> Output frequency f | 0.1 s | $\bigcirc$ |
| P01.07 | Time of ending section of acceleration S curve | Setting range: $0.0-50.0 \mathrm{~s}$ | 0.1 s | $\bigcirc$ |
| P01.08 | Stop mode | 0: Decelerate to stop; after stop command is valid, the VFD lowers output frequency based on the deceleration mode and the defined deceleration time, after the frequency drops to the stop speed (P01.15), the VFD stops. <br> 1: Coast to stop; after stop command is valid, the VFD stops output immediately, and the load coasts to stop as per mechanical inertia. | 0 | $\bigcirc$ |
| P01.09 | Starting frequency of DC brake after stop | Starting frequency of DC brake after stop; during decelerating to stop, when this frequency is reached, DC brake will be performed after stop. Demagnetization time (waiting time of DC brake | 0.00Hz | $\bigcirc$ |
| P01.10 | Waiting time of DC brake after stop | after stop): Before the DC brake, the VFD will block output, and after the demagnetization time elapses, DC brake will start. This function is used | 0.00s | $\bigcirc$ |
| P01.11 | DC brake current of stop | to prevent overcurrent fault caused by DC brake during high speed. <br> DC brake current after stop: it means the DC brake | 0.0\% | $\bigcirc$ |
| P01.12 | DC brake time of stop | force applied, the larger the current, the stronger the DC brake effect. | 0.00s | $\bigcirc$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ```Setting range of P01.09: \(0.00 \mathrm{~Hz}-\mathrm{P} 00.03\) (max. output frequency) Setting range of P01.10: 0.00-30.00s Setting range of P01.11: 0.0-100.0\% (of the rated VFD output current) Setting range of P01.12: 0.0-50.0s``` |  |  |
| P01.13 | Deadzone time of forward/revers e rotation | This function code refers to the transition time of the threshold set by P01.14 during setting forward/reverse rotation of the VFD, as shown below. <br> Setting range: 0.0-3600.0s | 0.0s | $\bigcirc$ |
| P01.14 | Forward/rever se rotation switch-over mode | 0 : Switch over after zero frequency <br> 1: Switch over after starting frequency <br> 2: Switch over after passing stop speed and delay | 1 | $\bigcirc$ |
| P01.15 | Stop speed | $0.00-100.00 \mathrm{~Hz}$ | 0.50 Hz | $\bigcirc$ |
| P01.16 | Stop speed detection mode | 0 : Set value of speed (the only detection mode valid in SVPWM mode) <br> 1: Detection value of speed | 0 | $\bigcirc$ |
| P01.17 | Stop speed detection time | 0.00-100.00s | 0.50s | $\bigcirc$ |
| P01.18 | Running protection of power-on terminal | When the running command channel is controlled by terminals, the system will detect running terminal state automatically during power up. <br> 0 : Terminal running command is invalid during power up. The VFD will not run during power up even if the running command terminal is detected to be valid, and the system is in running protection state. The VFD will run only after this terminal is cancelled and enabled again. <br> 1: Terminal running command is valid during power up. The system will start the VFD automatically after initialization is done if the running command terminal is detected to be valid during power up. <br> Note: This function must be set with caution, otherwise, serious consequences may occur. | 0 | $\bigcirc$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P01.19 | Action selection when the running frequency is below lower limit (lower limit should be larger than 0) | This function code is used to set the running state of VFD when the set frequency is below lower limit frequency. <br> Setting range: $0 \times 00-0 \times 12$ <br> Ones place: Action selection <br> 0 : Run in lower limit of the frequency <br> 1: Stop <br> 2: Sleep <br> Tens place: Stop mode <br> 0: Coast to stop <br> 1: Decelerate to stop <br> The VFD sleeps or stops in a way set in the tens place if the action selection is stop or sleep when the set frequency is lower than the lower limit. The VFD resumes the running state automatically when the set frequency is above the lower limit again and this situation lasts for the time set by P01.20. | 0x00 | $\bigcirc$ |
| P01.20 | Wake-up-from -sleep delay | This function code is used to set the sleep delay. When the running frequency of VFD is below the lower limit frequency, the VFD enters sleep state; when the set frequency is above the lower limit again and continues to be so after the time set by P01.20 elapses, the VFD will run automatically. <br> Set frequency curve <br> Running frequency curve: <br> Setting range: 0.0-3600.0s (valid when the ones place of P01.19 is 2) | 0.0s | $\bigcirc$ |
| P01.21 | Restart after power cut | This function code sets the automatic running of the VFD at next power-on after power down. <br> 0: Disabled restart <br> 1: Enable restart, namely the VFD will run automatically after the time set by P01.22 elapses if the starting conditions are met. | 0 | $\bigcirc$ |
| P01.22 | Waiting time of restart after power cut | This function code sets the waiting time before automatically running at next power-on after power down. | 1.0s | $\bigcirc$ |

P04-V/F control

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P04.00 | V/F curve setup of motor 1 | This group of function code defines the V/F curve of motor 1 to satisfy different load characteristics needs. <br> 0: Straight V/F curve; fit for constant-torque load <br> 1: Multi-point V/F curve <br> 2: Torque down V/F curve (power of 1.3) <br> 3: Torque down V/F curve (power of 1.7) <br> 4: Torque down V/F curve (power of 2.0) <br> Curve 2-4 are suitable for torque-variable load of fan pump and similar equipment. Users can make adjustment based on load characteristics to achieve optimal energy-saving effect. <br> 5: Customized V/F (V/F separation); under this mode, $V$ is separated from $f$. Users can adjust $f$ through the frequency reference channel set by P00.06 to change the curve characteristic, or adjust V through the voltage reference channel set by P04.27 to change the curve characteristics. <br> Note: The $\mathrm{V}_{\mathrm{b}}$ in the figure below corresponds to rated motor voltage, and $f_{b}$ corresponds to rated motor frequency. | 0 | $\bigcirc$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |
| P04.01 | Torque boost of motor 1 | In order to compensate for low-frequency torque characteristics, users can make some boost compensation to the output voltage. P04.01 is relative to the max. output voltage $\mathrm{V}_{\mathrm{b}}$. <br> P04.02 defines the percentage of cut-off frequency of manual torque boost to the rated motor frequency $f_{b}$. Torque boost can improve the low-frequency torque characteristics of V/F. Users should select torque boost based on the load, eg, larger load requires larger torque boost, however, if the torque boost is too large, the motor will run at over-excitation, which will cause increased output current and motor heat-up, thus degrading the efficiency. <br> When torque boost is set to $0.0 \%$, the VFD is automatic torque boost. <br> Torque boost cut-off threshold: Below this frequency threshold, the torque boost is valid, exceeding this threshold will nullify torque boost. <br> Setting range of P04.01: 0.0\%: (automatic) 0.1\%-10.0\% <br> Setting range of P04.02: 0.0\%-50.0\% | 0.0\% | $\bigcirc$ |
| P04.02 | Motor 1 torque boost cut-off |  | 20.0\% | O |
| P04.03 | V/F frequency point 1 of motor 1 | When $\mathrm{P} 04.00=1$ (multi-point V/F curve), users can set V/F curve via P04.03-P04.08. V/F curve is usually set according to the characteristics of motor load. <br> Note: $\mathrm{V} 1<\mathrm{V} 2<\mathrm{V} 3$, f1<f2<f3. If low-frequency voltage is set too high, motor overheat or burnt-down may occur, and overcurrent stall or overcurrent protection may occur to the VFD. | 0.00Hz | $\bigcirc$ |
| P04.04 | V/F voltage point 1 of motor 1 |  | 0.0\% | $\bigcirc$ |
| P04.05 | V/F frequency point 2 of motor 1 |  | 0.00Hz | $\bigcirc$ |
| P04.06 | V/F voltage point 2 of motor 1 |  | 0.0\% | $\bigcirc$ |
| P04.07 | V/F frequency point 3 of motor 1 |  | 0.00Hz | O |
| P04.08 | V/F voltage point <br> 3 of motor 1 |  | 0.0\% | O |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |

## P08-Enhanced functions

| $\begin{array}{\|c} \hline \text { Function } \\ \text { code } \end{array}$ | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P08.00 | Acceleration time 2 | See P00.11 and P00.12 for detailed definitions. The Goodrive350 IP55 high-ingress protection VFD defines four groups of acceleration/deceleration time, which can be selected by multi-function digital input terminal (P05 group). The acceleration/deceleration time of the VFD is the first group by default. Setting range: $0.0-3600.0 \mathrm{~s}$ | Model depended | $\bigcirc$ |
| P08.01 | Deceleration time 2 |  | Model depended | O |
| P08.02 | Acceleration time 3 |  | Model depended | $\bigcirc$ |
| P08.03 | Deceleration time 3 |  | Model depended | O |
| P08.04 | Acceleration time 4 |  | Model depended | $\bigcirc$ |
| P08.05 | Deceleration time 4 |  | Model depended | $\bigcirc$ |
| P08.06 | Running frequency of jogging | This function code is used to define the reference frequency of the VFD during jogging. <br> Setting range: $0.00 \mathrm{~Hz}-\mathrm{P} 00.03$ (max. output frequency) | 5.00 Hz | $\bigcirc$ |
| P08.07 | Acceleration time of jogging | Jogging acceleration time is the time needed for the VFD to accelerate from OHz to max. output frequency (P00.03). <br> Jogging deceleration time is the time needed | Model depended | $\bigcirc$ |
| P08.08 | Deceleration time of jogging | from decelerating from the max. output frequency (P00.03) to 0 Hz . <br> Setting range: 0.0-3600.0s |  | $\bigcirc$ |
| P08.09 | Jump frequency 1 | When the set frequency is within the range of jump frequency, the VFD will run at the boundary of jump frequency. <br> The VFD can avoid mechanical resonance point by setting the jump frequency, and three jump frequency points can be set. If the jump frequency points are set to 0 , this function will be invalid. | 0.00 Hz | $\bigcirc$ |
| P08.10 | Jump frequency amplitude 1 |  | 0.00 Hz | $\bigcirc$ |
| P08.11 | Jump frequency 2 |  | 0.00Hz | $\bigcirc$ |
| P08.12 | Jump frequency amplitude 2 |  | 0.00 Hz | $\bigcirc$ |
| P08.13 | Jump frequency 3 |  | 0.00 Hz | $\bigcirc$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P08.14 | Jump frequency amplitude 3 |  <br> Setting range: $0.00 \mathrm{~Hz}-\underline{P 00.03}$ (max. output frequency) | 0.00Hz | $\bigcirc$ |
| P08.15 | Amplitude of wobbling frequency | 0.0-100.0\% (relative to set frequency) | 0.0\% | $\bigcirc$ |
| P08.16 | Amplitude of jump frequency | $0.0-50.0 \%$ (relative to amplitude of wobbling frequency) | 0.0\% | $\bigcirc$ |
| P08.17 | Rise time of wobbling frequency | 0.1-3600.0s | 5.0s | $\bigcirc$ |
| P08.18 | Descend time of wobbling frequency | 0.1-3600.0s | 5.0s | $\bigcirc$ |
| P08.19 | Switching frequency of acceleration/dec eleration time | 0.00-P00.03 (max. output frequency) <br> 0.00 Hz : no switch-over <br> Switch to acceleration/deceleration time 2 if the running frequency is larger than P08.19 | 0.00Hz | $\bigcirc$ |
| P08.20 | Frequency threshold of the start of droop control | 0.00-50.00Hz | 2.00 Hz | $\bigcirc$ |
| P08.21 | Reference frequency of acceleration/dec eleration time | ```0: Max. output frequency 1: Set frequency 2: 100Hz Note: Valid for straight acceleration/deceleration only.``` | 0 | $\bigcirc$ |
| P08.22 | Reserved | / | 1 | 1 |
| P08.23 | Number of decimal points of frequency | 0: Two decimal points <br> 1: One decimal point | 0 | $\bigcirc$ |
| P08.24 | Number of decimal points of linear speed | 0: No decimal point 1: One 2: Two 3: Three | 0 | $\bigcirc$ |
| P08.25 | Set count value | P08.26-65535 | 0 | $\bigcirc$ |
| P08.26 | Designated count value | 0-P08.25 | 0 | $\bigcirc$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P08.27 | Set running time | 0-65535min | Omin | $\bigcirc$ |
| P08.28 | Automatic fault reset times | Automatic fault reset times: When the VFD selects automatic fault reset, it is used to set the | 0 | $\bigcirc$ |
| P08.29 | Automatic fault reset time interval | times exceeds the value set by P08.29, the VFD will report fault and stop to wait for repair. Interval of automatic fault reset: select the interval time from when fault occurred to automatic fault reset actions. <br> After VFD starts, if no fault occurred during 60s, the fault reset times will be zeroed out. <br> Setting range of P08.28: 0-10 <br> Setting range of P08.29: 0.1-3600.0s | 1.0s | $\bigcirc$ |
| P08.30 | Reduction ratio of droop control | This function code sets the variation rate of the VFD output frequency based on the load; it is mainly used in balancing the power when multiple motors drive the same load. <br> Setting range: $0.00-50.00 \mathrm{~Hz}$ | 0.00Hz | $\bigcirc$ |

P09—PID control

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P09.00 | PID reference source | When frequency command (P00.06, $\underline{\mathrm{P} 00.07 \text { ) is }}$ set to 7 , or channel of voltage setup (P04.27) is set to 6, the VFD running mode is process PID control. <br> This parameter determines the target reference channel of process PID. <br> 0: Set by P09.01 <br> 1: Al1 <br> 2: Al2 <br> 3: Al3 <br> 4: High-speed pulse HDIA <br> 5: Multi-step <br> 6: Modbus/Modbus TCP communication <br> 7: PROFIBUS/CANopen/DeviceNet communication <br> 8: Ethernet communication <br> 9: High-speed pulse HDIB <br> 10: EtherCAT/PROFITNET/Ethernet IP communication <br> 11: Programmable expansion card <br> 12: Reserved <br> The set target value of process PID is relative value, the set $100 \%$ corresponds to $100 \%$ of the feedback signal of controlled system. <br> The system operates based on the relative value (0-100.0\%) | 0 | $\bigcirc$ |
| P09.01 | PID digital setting | Users need to set this parameter when P09.00 is set to 0 , the reference value of this parameter is the feedback variable of the system. <br> Setting range: - $100.0 \%-100.0 \%$ | 0.0\% | $\bigcirc$ |
| P09.02 | PID feedback source | This parameter is used to select PID feedback channel. <br> 0: Al1 <br> 1: Al2 <br> 2: Al3 <br> 3: High-speed pulse HDIA <br> 4: Modbus/Modbus TCP communication <br> 5: PROFIBUS/CANopen/DeviceNet <br> communication <br> 6: Ethernet communication <br> 7: High-speed pulse HDIB <br> 8: EtherCAT/PROFITNET/Ethernet IP <br> communication <br> 9: Programmable expansion card <br> 10: Reserved | 0 | $\bigcirc$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Note: The reference channel and feedback channel cannot overlap; otherwise, PID cannot be controlled effectively. |  |  |
| P09.03 | PID output characteristics | 0: PID output is positive characteristic: namely, the feedback signal is larger than the PID reference, which requires the VFD output frequency to decrease for PID to reach balance, eg, tension PID control of winding <br> 1: PID output is negative characteristics: namely the feedback signal is less than PID reference, which requires VFD output frequency to increase for PID to reach balance, eg, tension PID control of unwinding. | 0 | $\bigcirc$ |
| P09.04 | Proportional gain (Kp) | This function code is suitable for proportional gain P of PID input. <br> It determines the regulation intensity of the whole PID regulator, the larger the value of $P$, the stronger the regulation intensity. If this parameter is 100 , it means when the deviation between PID feedback and reference is $100 \%$, the regulation amplitude of PID regulator (ignoring integral and differential effect) on output frequency command is the max. frequency (ignoring integral and differential actions). <br> Setting range: $0.00-100.00$ | 1.80 | $\bigcirc$ |
| P09.05 | Integral time (Ti) | This parameter determines the speed of PID adjustor to carry out integral adjustment on the deviation between PID feedback and reference. When the deviation between PID feedback and reference is $100 \%$, the integral adjustor works continuously after the time (ignoring the proportional effect and differential effect) to achieve the max. output frequency (P00.03) or the max. voltage (P04.31). <br> Shorter the integral time is, stronger the regulation intensity is. <br> Setting range: $0.00-10.00 \mathrm{~s}$ | 0.90s | $\bigcirc$ |
| P09.06 | Differential time (Td) | This parameter determines the strength of the change ratio when PID carries out integral adjustment on the deviation of PID feedback and reference. <br> If the PID feedback changes by $100 \%$ during this period, the adjustment of differential regulator (ignoring the proportional effect and differential effect) is the max. output frequency (P00.03) or the max. voltage (P04.31). Longer | 0.00s | $\bigcirc$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
|  |  | the derivative time is, stronger the regulation intensity is. <br> Setting range: $0.00-10.00 \mathrm{~s}$ |  |  |
| P09.07 | Sampling cycle <br> ( T ) | It means the sampling cycle of feedback. The regulator operates once during each sampling cycle. The larger the sampling cycle, the slower the response. <br> Setting range: $0.001-10.000$ s | 0.001s | $\bigcirc$ |
| P09.08 | Limit of PID control deviation | It is the max. allowable deviation of PID system output value relative to closed-loop reference value. Within this limit, PID regulator stops regulation. Set this function code properly to regulate the precision and stability of PID system. | 0.0\% | $\bigcirc$ |
| P09.09 | Upper limit value of PID output | These two function codes are used to set the upper/lower limit value of PID regulator. | 100.0\% | $\bigcirc$ |
| P09.10 | Lower limit value of PID output | (P00.03) or max. voltage (P04.31) <br> Setting range of P09.09: P09.10-100.0\% <br> Setting range of P09.10: -100.0\%-P09.09 | 0.0\% | $\bigcirc$ |
| P09.11 | Feedback offline detection value | Set PID feedback offline detection value, when the detection value is no more than the feedback | 0.0\% | $\bigcirc$ |
| P09.12 | Feedback offline detection time | offline detection value, and the duration exceeds the value set in P09.12, the VFD will report "PID feedback offline fault", and keypad displays PIDE. | 1.0s | $\bigcirc$ |

## P17-State-check functions

| Function <br> code | Name | Description | Default <br> value | Modify |
| :---: | :---: | :--- | :---: | :---: |
| P17.00 | Set frequency | Display current set frequency of the VFD. <br> Range: $0.00 \mathrm{~Hz}-\mathrm{P00.03}$ | 0.00 Hz | $\bullet$ |
| P17.01 | Output frequency | Display current output frequency of the VFD. <br> Range: $0.00 \mathrm{~Hz}-\mathrm{P00.03}$ | 0.00 Hz | $\bullet$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P17.02 | Ramps reference frequency | Display current ramps reference frequency of the VFD. <br> Range: $0.00 \mathrm{~Hz}-\mathrm{P00.03}$ | 0.00Hz | $\bullet$ |
| P17.03 | Output voltage | Display current output voltage of the VFD. <br> Range: 0-1200V | OV | $\bullet$ |
| P17.04 | Output current | Display the valid value of current output current of the VFD. <br> Range: 0.0-5000.0A | 0.0A | $\bullet$ |
| P17.05 | Motor speed | Display current motor speed. <br> Range: 0-65535RPM | 0 RPM | $\bullet$ |
| P17.06 | Torque current | Display current torque current of the VFD. <br> Range: -3000.0-3000.0A | 0.0A | - |
| P17.07 | Exciting current | Display current exciting current of the VFD. <br> Range: -3000.0-3000.0A | 0.0A | $\bullet$ |
| P17.08 | Motor power | Display current motor power; $100 \%$ relative to rated motor power, positive value is motoring state, negative value is generating state. <br> Range: $-300.0-300.0 \%$ (relative to rated motor power) | 0.0\% | - |
| P17.09 | Motor output torque | Display current output torque of the VFD; $100 \%$ relative to rated motor torque, during forward running, positive value is motoring state, negative value is generating state, during reverse running, positive value is generating state, negative value is motoring state. <br> Range: -250.0-250.0\% | 0.0\% | $\bullet$ |
| P17.10 | Estimated motor frequency | The estimated motor rotor frequency under open-loop vector condition. <br> Range: 0.00-P00.03 | 0.00Hz | $\bullet$ |
| P17.11 | DC bus voltage | Display current DC bus voltage of the VFD. <br> Range: 0.0-2000.0V | 0.0V | - |
| P17.12 | Digital input terminal state | Display current digital input terminal state of the VFD. $0 \times 00-0 \times 3 F$ <br> Corresponds to HDIB, HDIA, S4, S3, S2 and S1 respectively | 0x00 | - |
| P17.13 | Digital output terminal state | Display current digital output terminal state of the VFD. <br> $0 \times 00-0 \times 0 F$ <br> Corresponds to R02, RO1, HDO and Y1 respectively | 0x00 | - |
| P17.14 | Digital adjustment variable | Display the regulating variable by UP/DOWN terminals of the VFD. <br> Range: $0.00 \mathrm{~Hz}-\mathrm{P00.03}$ | 0.00Hz | $\bullet$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P17.15 | Torque reference value | Relative to percentage of the rated torque of current motor, display torque reference. <br> Range: -300.0\%-300.0\% (rated motor current) | 0.0\% | $\bullet$ |
| P17.16 | Linear speed | 0-65535 | 0 | $\bullet$ |
| P17.17 | Reserved | / | 1 | 1 |
| P17.18 | Count value | 0-65535 | 0 | $\bullet$ |
| P17.19 | Al1 input voltage | Display input signal of AI 1 <br> Range: 0.00-10.00V | 0.00V | $\bullet$ |
| P17.20 | Al2 input voltage | Display input signal of AI2 <br> Range: -10.00V-10.00V | 0.00 V | $\bullet$ |
| P17.21 | HDIA input frequency | Display input frequency of HDIA Range: $0.000-50.000 \mathrm{kHz}$ | $\begin{gathered} \hline 0.000 \\ \mathrm{kHz} \\ \hline \end{gathered}$ | $\bullet$ |
| P17.22 | HDIB input frequency | Display input frequency of HDIB Range: $0.000-50.000 \mathrm{kHz}$ | 0.000 kHz | $\bullet$ |
| P17.23 | PID reference value | Display PID reference value <br> Range: -100.0-100.0\% | 0.0\% | $\bullet$ |
| P17.24 | PID feedback value | Display PID feedback value <br> Range: -100.0-100.0\% | 0.0\% | $\bullet$ |
| P17.25 | Motor power factor | Display the power factor of current motor. <br> Range: -1.00-1.00 | 0.00 | - |
| P17.26 | Current running time | Display current running time of the VFD. Range: 0-65535min | Omin | $\bullet$ |
| P17.27 | Actual stage of simple PLC | Displays the present stage of the simple PLC function. | 0 | $\bullet$ |
| P17.28 | Motor ASR controller output | Display the speed loop ASR controller output value under vector control mode, relative to the percentage of rated torque of the motor. <br> Range: -300.0\%-300.0\% (rated motor current) | 0.0\% | $\bullet$ |
| P17.29 | Pole angle of open-loop <br> synchronous motor | Display initial identification angle of synchronous motor <br> Range: 0.0-360.0 | 0.0 | - |
| P17.30 | Phase compensation of synchronous motor | Display phase compensation of synchronous motor <br> Range: -180.0-180.0 | 0.0 | $\bullet$ |
| P17.31 | High-frequency superposition current of synchronous motor | 0.0\%-200.0\% (rated motor current) | 0.0 | $\bullet$ |
| P17.32 | Motor flux linkage | 0.0\%-200.0\% | 0.0\% | $\bullet$ |
| P17.33 | Exciting current reference | Display the exciting current reference value under vector control mode <br> Range: -3000.0-3000.0A | 0.0A | $\bullet$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P17.34 | Torque current reference | Display torque current reference value under vector control mode <br> Range: -3000.0-3000.0A | 0.0A | $\bullet$ |
| P17.35 | AC incoming current | Display the valid value of incoming current on AC side <br> Range: 0.0-5000.0A | 0.0A | $\bullet$ |
| P17.36 | Output torque | Display output torque value, during forward running, positive value is motoring state, negative value is generating state; during reverse running, positive value is generating state, negative value is motoring state. <br> Range: $-3000.0 \mathrm{Nm}-3000.0 \mathrm{Nm}$ | 0.0 Nm | $\bullet$ |
| P17.37 | Motor overload count value | 0-65535 | 0 | $\bullet$ |
| P17.38 | $\begin{gathered} \text { Process PID } \\ \text { output } \end{gathered}$ | -100.0\%-100.0\% | 0.0\% | $\bullet$ |
| P17.39 | Parameter download wrong function code | 0.00-99.00 | 0.00 | $\bullet$ |
| P17.40 | Motor control mode | 0x000-0x123 <br> Ones: Control mode <br> 0: Vector 0 <br> 1: Vector 1 <br> 2: VF control <br> 3: Closed-loop vector control <br> Tens: Control state <br> 0: Speed control <br> 1: Torque control <br> 2: Position control <br> Hundreds: Motor number <br> 0: Motor 1 <br> 1: Motor 2 | 0x000 | $\bullet$ |
| P17.41 | Upper limit of the torque when motoring | 0.0\%-300.0\% (rated motor current) | 0.0\% | - |
| P17.42 | Upper limit of brake torque | 0.0\%-300.0\% (rated motor current) | 0.0\% | $\bullet$ |
| P17.43 | Upper limit frequency of forward running of torque control | 0.00-P00.03 | 0.00Hz | - |

P18-Closed-loop control state check

| Function <br> code | Name | Description | Default <br> value | Modify |
| :---: | :---: | :--- | :---: | :---: |
| P18.00 | Actual frequency <br> of encoder | The actual-measured encoder frequency; the <br> value of forward running is positive; the value of <br> reverse running is negative. <br> Range: -999.9-3276.7Hz | 0.0 Hz | $\bullet$ |

| Function code | Name | Description | Default value | Modify |
| :---: | :---: | :---: | :---: | :---: |
| P18.01 | Encoder position count value | Encoder count value, quadruple frequency, <br> Range: 0-65535 | 0 | $\bullet$ |
| P18.02 | Encoder Z pulse count value | Corresponding count value of encoder Z pulse. Range: 0-65535 | 0 | $\bullet$ |
| P18.03 | High bit of position reference value | High bit of position reference value, zero out after stop. <br> Range: 0-30000 | 0 | $\bullet$ |
| P18.04 | Low bit of position reference value | Low bit of position reference value, zero out after stop. <br> Range: 0-65535 | 0 | $\bullet$ |
| P18.05 | High bit of position feedback value | High bit of position feedback value, zero out after stop. <br> Range: 0-30000 | 0 | $\bullet$ |
| P18.06 | Low bit of position feedback value | Low bit of position feedback value, zero out after stop. <br> Range: 0-65535 | 0 | $\bullet$ |
| P18.07 | Position deviation | Deviation between current reference position and actual running position. <br> Range: -32768-32767 | 0 | $\bullet$ |
| P18.08 | Position of position reference point | Position of reference point of $Z$ pulse when the spindle stops accurately. <br> Range: 0-65535 | 0 | $\bullet$ |
| P18.09 | Current position setup of spindle | Current position setup when the spindle stops accurately. <br> Range: 0-359.99 | 0.00 | $\bullet$ |
| P18.10 | Current position when spindle stops accurately | Current position when spindle stops accurately. Range: 0-65535 | 0 | $\bullet$ |
| P18.11 | Encoder Z pulse direction | Z pulse direction display. When the spindle stops accurately, there may be a couple of pulses' error between the position of forward and reverse orientation, which can be eliminated by adjusting Z pulse direction of P20.02 or exchanging phase $A B$ of encoder. <br> 0 : Forward <br> 1: Reverse | 0 | - |
| P18.12 | Encoder Z pulse angle | Reserved. <br> Range: 0.00-359.99 | 0.00 | - |
| P18.13 | Encoder Z pulse error times | Reserved. <br> Range: 0-65535 | 0 | $\bullet$ |
| P18.14 | High bit of encoder pulse count value | 0-65535 | 0 | $\bullet$ |
| P18.15 | Low bit of encoder pulse count value | 0-65535 | 0 | $\bullet$ |

## 7 Troubleshooting

### 7.1 What this chapter contains

The chapter tells users how to reset faults and check faults history. A complete list of alarms and fault information as well as possible causes and corrective measures are presented in this chapter.

Only well-trained and qualified professionals are allowed to carry out the work described in this chapter. Operations should be carried out according to the instructions presented in 1 "Safety Precautions".

### 7.2 Indications of alarms and faults

The fault is indicated by indicators (refer to the "Keypad operation process"). When TRIP indicator is on, the alarm or fault code displayed in the keypad indicates the VFD is in exception state. This chapter covers most of the alarms and faults, and their possible causes and corrective measures, if users cannot figure out the alarm or fault causes, contact local INVT office.

### 7.3 Fault reset

Users can reset the VFD via STOP/RST key on the keypad, digital inputs, or by cutting off the VFD power. After faults are removed, the motor can be start again.

### 7.4 Fault history

P07.27-P07.32 record the six latest fault types; P07.33-P07.40, P07.41-P07.48, and P07.49P07.56 record the running data of the VFD when the latest three faults occurred.

### 7.5 VFD faults and solutions

When fault occurred, process the fault as shown below.

1. When VFD fault occurred, confirm whether keypad display is improper? If yes, contact INVT;
2. If keypad works properly, check the function codes in P07 group to confirm the corresponding fault record parameters, and determine the real state when current fault occurred through parameters;
3. Check the table below to see whether corresponding exception states exist based on the corresponding corrective measures;
4. Rule out the faults or ask for help from professionals;
5. After confirming faults are removed, reset the fault and start running.

### 7.5.1 Details of faults and solutions

Note: The numbers enclosed in square brackets such as [1], [2] and [3] in the Fault type column in the following table indicate the VFD fault type codes read through communication.

| Fault <br> code | Fault type | Possible cause | Corrective measures |
| :---: | :---: | :--- | :--- |
| OUt1 | $[1]$Inverter unit U phase <br> protection | Acceleration is too fast; <br> IGBT module is damaged; | Increase acceleration time; <br> Replace the power unit; |

| Fault code | Fault type | Possible cause | Corrective measures |
| :---: | :---: | :---: | :---: |
| OUt2 | [2] Inverter unit V phase protection | Misacts caused byinterference; drive wires arepoorly connected;To-ground short circuit occurs | Check drive wires; <br> Check whether there is strong interference surrounds the peripheral equipment |
| OUt3 | [3] Inverter unit W phase protection |  |  |
| OV1 | [7] Overvoltage during acceleration | Deceleration time is too short; Exception occurred to input voltage; <br> Large energy feedback; <br> Lack of brake units; <br> Dynamic brake is not enabled, and the deceleration time is too short. | Check input power; Check whether load deceleration time is too short; or the motor starts during rotating; Install dynamic brake units; Check the setup of related function codes |
| OV2 | [8] Overvoltage during deceleration |  |  |
| OV3 | [9] Overvoltage during constant speed running |  |  |
| OC1 | [4] Overcurrent during acceleration | Acceleration is too fast; Grid voltage is too low; VFD power is too small; Load transient or exception occurred; <br> To-ground short circuit or output phase loss occur; Strong external interference sources; <br> Overvoltage stall protection is not enabled | Increase ACC/DEC time; Check input power; <br> Select the VFD with larger power; <br> Check if the load is short circuited (to-ground short circuit or line-to-line short circuit) or the rotation is not smooth; <br> Check the output wiring; Check if there is strong interference; <br> Check the setup of related function codes. |
| OC2 | [5] Overcurrent during deceleration |  |  |
| OC3 | [6] Overcurrent during constant speed running |  |  |
| UV | [10] Bus undervoltage fault | Grid voltage is too low; Overvoltage stall protection is not enabled | Check grid input power; Check the setup of related function codes |
| OL1 | [11] Motor overload | Grid voltage is too low; <br> Rated motor current is set improperly; <br> Motor stall or load jumps violently | Check grid voltage; <br> Reset rated motor current; Check the load and adjust torque boost |
| OL2 | [12] VFD overload | Acceleration is too fast; <br> The motor in rotating is restarted; <br> Grid voltage is too low; <br> Load is too large; <br> Power is too small; | Increase acceleration time; <br> Avoid restart after stop; <br> Check grid voltage; <br> Select the VFD with larger <br> power; <br> Select proper motor |
| SPI | [13] Phase loss on input side | Phase loss or violent fluctuation occurred to R, S and T input | Check the input power; Check installation wiring |
| SPO | [14] Phase loss on output side | Phase loss occurred to U, V, W output (or the three phases of | Check the output wiring; Check the motor and cable |

| Fault code | Fault type | Possible cause | Corrective measures |
| :---: | :---: | :---: | :---: |
|  |  | motor is asymmetrical) |  |
| OH1 | [15] Overheat of rectifier module | Air duct is blocked or fan is damaged; <br> Ambient temperature is too high; Long-time overload running | Ventilate the air duct or replace the fan; <br> Lower the ambient temperature |
| OH2 | [16] Overheat of inverter module |  |  |
| EF | [17] External fault | SI external fault input terminal acts | Check external device input |
| CE | [18] Modbus/Modbus TCP communication fault | Baud rate is set improperly; Communication line fault; Communication address error; Communication suffers from strong interference | Set proper baud rate; Check the wiring of communication interfaces; Set proper communication address; <br> Replace or change the wiring to enhance anti-interference capacity |
| ItE | [19] Current detection fault | Poor contact of the connector of control board; <br> Hall component is damaged; Exception occurred to amplification circuit | Check the connector and re-plug; <br> Replace the hall component; <br> Replace the main control board |
| tE | [20] Motor autotuning fault | Motor capacity does not match with the VFD capacity, this fault may occur easily if the difference between them is exceeds five power classes; Motor parameter is set improperly; <br> The parameters gained from autotuning deviate sharply from the standard parameters; Autotuning timeout | Change the VFD model, or adopt V/F mode for control; Set proper motor type and nameplate parameters; Empty the motor load and carry out autotuning again; Check motor wiring and parameter setup; Check whether upper limit frequency is larger than $2 / 3$ of the rated frequency |
| EEP | [21] EEPROM fault | R/W error occurred to the control parameters; <br> EEPROM is damaged | Press STOP/RST to reset; Replace the main control board |
| PIDE | [22] PID feedback offline fault | PID feedback offline; <br> PID feedback source disappears; | Check PID feedback signal wires; <br> Check PID feedback source |
| bCE | [23] Braking unit fault | Brake circuit fault or brake tube is damaged; <br> The resistance of external brake resistor is too small | Check the brake unit, replace with new brake tubes; <br> Increase brake resistance |
| END | [24] Running time is up | The actual running time of the VFD is larger than the set running time | Ask help from the supplier, adjust the set running time |

| Fault code | Fault type | Possible cause | Corrective measures |
| :---: | :---: | :---: | :---: |
| OL3 | [25] Electronic overload fault | The VFD releases overload pre-alarm based on the set value | Check the load and overload threshold |
| PCE | [26] Keypad communication fault | The keypad wire is poorly contacted or disconnected; The keypad wire is too long and suffers strong interference; Circuit fault occurred to the keypad or communication part of the main board | Check the keypad wires to confirm whether fault exists; Check the surroundings to rule out interference source; Replace the hardware and ask for maintenance service |
| UPE | [27] Parameter upload error | The keypad wire is poorly contacted or disconnected; The keypad wire is too long and suffers strong interference; Circuit fault occurred to the keypad or communication part of the main board | Check the surroundings to rule out interference source; Replace the hardware and ask for maintenance service; <br> Replace the hardware and ask for maintenance service |

| OtE2 | [71] EC PT1000 detected OH | The PT1000 temperature sensor is inaccurate or not calibrated. <br> Device or ambient temperature is too high. | Calibrate the sensor through parameter settings. Lower the device or ambient temperature. |
| E-EIP | [72] EtherNet IP communication timeout | There is no data transmission between the communication card and the host controller (or PLC). | Check whether the communication card wiring is loose or dropped. |
| E-PAO | [73] No upgrade bootloader | The upgrade bootloader is missing. | Contact us. |
| E-Al1 | [74] Al1 disconnection | Input voltage of Al1 is too low; Al1 wiring is disconnected. | Connect a 5 V or 10 mA power source to check whether the input is normal; Check the wiring or replace the cables. |

| Fault <br> code | Fault type | Possible cause | Corrective measures |
| :---: | :---: | :--- | :--- |
| E-AI2 | [75] Al2 disconnection | Input voltage of Al2 is too low; <br> Al2 wiring is disconnected. | Connect a 5V or 10mA <br> power source to check <br> whether the input is normal; <br> Check the wiring or replace <br> the cables. |
| E-AI3 | [76] Al3 disconnection | Input voltage of Al3 is too low; <br> Al4 wiring is disconnected. | Connect a 5V or 10mA <br> power source to check <br> whether the input is normal; <br> Check the wiring or replace <br> the cables. |

### 7.5.2 Other state

| Displayed code | State type | Possible cause | Solution |
| :---: | :---: | :--- | :--- |
| PoFF | System power <br> failure | The system is powered off or the <br> bus voltage is too low. | Check the grid <br> conditions. |

### 7.6 Analysis on common faults

### 7.6.1 Motor fails to work

### 7.6.2 Motor vibrates

### 7.6.3 Overvoltage

### 7.6.4 Undervoltage

### 7.6.5 Unusual heating of motor

### 7.6.6 VFD overheating

### 7.6.7 Motor stalls during ACC

### 7.6.8 Overcurrent

### 7.7 Countermeasures on common interference

### 7.7.1 Interference on meter switches and sensors

## Interference phenomenon:

Pressure, temperature, displacement, and other signals of a sensor are collected and displayed by a human-machine interaction device. The values are incorrectly displayed as follows after the VFD is started:

1. The upper or lower limit is wrongly displayed, for example, 999 or -999.
2. The display of values jumps (usually occurring on pressure transmitters).
3. The display of values is stable, but there is a large deviation, for example, the temperature is dozens of degrees higher than the common temperature (usually occurring on thermocouples).
4. A signal collected by a sensor is not displayed but functions as a drive system running feedback signal. For example, a VFD is expected to decelerate when the upper pressure limit of the compressor is reached, but in actual running, it starts to decelerate before the upper pressure limit is reached.
5. After a VFD is started, the display of all kinds of meters (such as frequency meter and current meter) that are connected to the analog output (AO) terminal of the VFD is severely affected, displaying the values incorrectly.
6. Proximity switches are used in the system. After a VFD is started, the indicator of a proximity switch flickers, and the output level flips.

## Solution:

1. Check and ensure that the feedback cable of the sensor is 20 cm or farther away from the motor cable.
2. Check and ensure that the ground wire of the motor is connected to the PE terminal of the VFD (if the ground wire of the motor has been connected to the ground block, you need to use a multimeter to measure and ensure that the resistance between the ground block and PE terminal is lower than $1.5 \Omega$ ).
3. Try to add a safety capacitor of $0.1 \mu \mathrm{~F}$ to the signal end of the feedback signal terminal of the sensor.
4. Try to add a safety capacitor of $0.1 \mu \mathrm{~F}$ to the power end of the sensor meter (pay attention to the voltage of the power supply and the voltage endurance of the capacitor).
5. For interference on meters connected to the AO terminal of a VFD, if AO uses current signals of 0 to 20 mA , add a capacitor of $0.47 \mu \mathrm{~F}$ between the AO and GND terminals; and if AO uses voltage signals of 0 to 10 V , add a capacitor of $0.1 \mu \mathrm{~F}$ between the AO and GND terminals.

## Note:

1. When a decoupling capacitor is required, add it to the terminal of the device connected to the sensor. For example, if a thermocouple is to transmit signals of 0 to 20 mA to a temperature meter, the capacitor needs to be added on the terminal of the temperature meter.; if an electronic ruler is to transmit signals of 0 to 30 V to a PLC signal terminal, the capacitor needs to be added on the terminal of the PLC.
2. If a large number of meters or sensors are disturbed. It is recommended that you configure an external C2 filter on the input power end of the VFD. For models of filters, see section D. 7 "Filters".

### 7.7.2 Interference on communication

## Interference phenomenon

The interference described in this section on 485 communication mainly includes communication delay, out of sync, occasional power-off, or complete power-off that occurs after a VFD is started.

If the communication cannot be implemented properly, regardless of whether the VFD is running, the exception is not necessarily caused by interference. You can find out the causes as follows:

1. Check whether the 485 communication bus is disconnected or in poor contact.
2. Check whether the two ends of line A or B are connected reversely.
3. Check whether the communication protocol (such as the baud rate, data bits, and check bit) of the VFD is consistent with that of the upper computer.
If you are sure that communication exceptions are caused by interference, you can resolve the problem through the following measures:
4. Simple inspection.
5. Arrange the communication cables and motor cables in different cable trays.
6. In multi-VFD application scenarios, adopt the chrysanthemum connection mode to connect the communication cables between VFDs, which can improve the anti-interference capability.
7. In multi-VFD application scenarios, check and ensure that the driving capacity of the master is sufficient.
8. In the connection of multiple VFDs, you need to configure one $120 \Omega$ terminal resistor on each end.

## Solution:

1. Check and ensure that the ground wire of the motor is connected to the PE terminal of the VFD (if the ground wire of the motor has been connected to the ground block, you need to use a multimeter to measure and ensure that the resistance between the ground block and PE terminal is lower than $1.5 \Omega$ ).
2. Do not connect the VFD and motor to the same ground terminal as the upper computer. It is recommended that you connect the VFD and motor to the power ground, and connect the upper computer separately to a ground stud.
3. Try to short the signal reference ground terminal (GND) of the VFD with that of the upper computer controller to ensure that ground potential of the communication chip on the control board of the VFD is consistent with that of the communication chip of the upper computer.
4. Try to short GND of the VFD to its ground terminal (PE).
5. Try to add a safety capacitor of $0.1 \mu \mathrm{~F}$ on the power terminal of the upper computer (PLC, HMI, and touch screen). During this process, pay attention to the voltage of the power supply and the voltage endurance capability of the capacitor. Alternatively, you can use a magnet ring (Fe-based nanocrystalline magnet rings are recommended). Put the power L/N line or $+/$ - line of the upper computer through the magnet ring in the same direction and wind 8 coils around the magnet ring.

### 7.7.3 Failure to stop and indicator shimmering due to motor cable coupling

## Interference phenomenon:

1. Failure to stop

In a VFD system where an S terminal is used to control the start and stop, the motor cable and control cable are arranged in the same cable tray. After the system is started properly, the $S$ terminal cannot be used to stop the VFD.
2. Indicator shimmering

After a VFD is started, the relay indicator, power distribution box indicator, PLC indicator, and indication buzzer shimmers, blinks, or emits unusual sounds unexpectedly.

## Solution:

1. Check and ensure that the exception signal cable is arranged 20 cm or farther away from the motor cable.
2. Add a safety capacitor of $0.1 \mu \mathrm{~F}$ between the digital input terminal $(\mathrm{S}$ ) and the COM terminal.
3. Connect the digital input terminal (S) that controls the start and stop to other idle digital input terminals in parallel. For example, if S 1 is used to control the start and stop and S 4 is idle, you can try to connect connect S 1 to S 4 in parallel.

Note: If the controller (such as PLC) in the system controls more than 5 VFDs at the same time through digital input terminals $(\mathrm{S})$, this scheme is not available.

### 7.7.4 Leakage current and interference on RCD

VFDs output high-frequency PWM voltage to drive motors. In this process, the distributed capacitance between the internal IGBT of a VFD and the heat sink and that between the stator and rotor of a motor may inevitably cause the VFD to generate high-frequency leakage current to the ground. A residual current operated protective device (RCD) is used to detect the power-frequency leakage current when a grounding fault occurs on a circuit. The application of a VFD may cause misoperation of a RCD.

1. Rules for selecting RCDs
(1) VFD systems are special. In these systems, it is required that the rated residual current of common RCDs at all levels is larger than 200 mA , and the VFDs are grounded reliably.
(2) For RCDs, the time limit of an action needs to be longer than that of a next action, and the time difference between two actions need to be longer than 20 ms . For example, 1s, 0.5 s , and 0.2 s .
(3) For circuits in VFD systems, electromagnetic RCDs are recommended. Electromagnetic RCDs have strong anti-interference capability, and thus can prevent the impact of high-frequency leakage current.

| Electronic RCD | Electromagnetic RCD |
| :--- | :--- |
| Low cost, high sensitivity, small in volume, <br> susceptible to voltage fluctuation of the grid and <br> ambient temperature, weak anti-interference <br> capability | Requiring highly sensitive, accurate, and stable <br> zero-phase sequence current transformer, using <br> permalloy high-permeability materials, complex <br> process, high cost, not susceptible to voltage <br> fluctuation of the power supply and ambient <br> temperature, strong anti- interference capability |

2. Solution to RCD misoperation (handling the VFD)
(1) Try to remove the jumper cap at "EMC/J10" on the middle casing of the VFD.
(2) Try to reduce the carrier frequency to $1.5 \mathrm{kHz}(\mathrm{P} 00.14=1.5)$.
(3) Try to modify the modulation mode to "3PH modulation and 2PH modulation" ( $\mathrm{P} 8.40=0$ ).
3. Solution to RCD misoperation (handling the system power distribution)
(1) Check and ensure that the power cable is not soaking in water.
(2) Check and ensure that the cables are not damaged or spliced.
(3) Check and ensure that no secondary grounding is performed on the neutral wire.
(4) Check and ensure that the main power cable terminal is in good contact with the air switch or contactor (all screws are tightened).
(5) Check 1PH powered devices, and ensure that no earth lines are used as neutral wires by these devices.
(6) Do not use shielded cables as VFD power cables and motor cables.

### 7.7.5 Live device chassis

## Phenomenon

After a VFD is started, there is sensible voltage on the chassis, and you may feel an electric shock when touching the chassis. The chassis, however, is not live (or the voltage is far lower than the human safety voltage) when the VFD is powered on but not running.

## Solution

1. If there is power distribution grounding or ground stud on the site, ground the cabinet chassis of the drive system through the power ground or stud.
2. If there is no grounding on the site, you need to connect the motor chassis to the ground terminal PE of the VFD, and ensure that the jumper at "EMC/J10" on the middle casing of the VFD is shorted.

## 8 Maintenance and hardware fault diagnosis

### 8.1 What this chapter contains

This chapter describes how to carry out preventive maintenance on Goodrive350 IP55 high protection series VFDs.

### 8.2 Periodical inspection

Little maintenance is required when VFDs are installed in environments that meet requirements. The following table describes the routine maintenance periods recommended by INVT.

| Subject |  | Item | Method | Criterion |
| :---: | :---: | :---: | :---: | :---: |
| Ambient environment |  | Check the temperature, and humidity, and whether there is vibration, dust, gas, oil spray, and water droplets in the environment. | Visual inspection, and use instruments for measurement. | The requirements stated in this manual are met. |
|  |  | Check whether there are foreign matters, such as tools, or dangerous substances placed nearby. | Visual inspection | There are no tools or dangerous substances placed nearby. |
| Voltage |  | Check the voltage of the main circuit and control circuit. | Use multimeters or other instruments for measurement. | The requirements stated in this manual are met. |
| Keypad |  | Check the display of information. | Visual inspection | The characters are displayed properly. |
|  |  | Check whether characters are not completely displayed. | Visual inspection | The requirements stated in this manual are met |
| Main circuit | Common | Check whether the bolts loose or come off. | Screw them up. | No exception occurs. |
|  |  | Check whether the machine is deformed, cracked, or damaged, or their color changes due to overheating and aging. | Visual inspection | No exception occurs. |
|  |  | Check whether there are stains and dust attached. | Visual inspection | No exception occurs. <br> Note: <br> Discoloration of copper bars does not mean that they cannot work properly. |
|  | Conductor and wire | Check whether the conductors are deformed or their color change due to overheat. | Visual inspection | No exception occurs. |

Maintenance and hardware fault diagnosis

| Subject |  | Item | Method | Criterion |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Check whether the wire sheaths are cracked or their color changes. | Visual inspection | No exception occurs. |
|  | Terminal block | Check whether there is damage. | Visual inspection | No exception occurs. |
|  | Filter capacitor | Check whether there is electrolyte leakage, discoloration, cracks, and chassis expansion. | Visual inspection | No exception occurs. |
|  |  | Check whether the safety valves are released. | Determine the service life based on the maintenance information, or measure them through electrostatic capacity. | No exception occurs. |
|  |  | Check whether the electrostatic capacity is measured as required. | Use instruments to measure the capacity. | Electrostatic capacity $\geq$ initial value $\times 0.85$ |
|  | Resistor | Check whether there is displacement caused due to overheat. | Olfactory and visual inspection | No exception occurs. |
|  |  | Check whether the resistors are disconnected. | Visual inspection, or remove one end of the connection cable and use a multimeter for measurement. | Resistance range: $\pm 10 \%$ (of the standard resistance) |
|  | Transformer and reactor | Check whether there is unusual vibration sounds or smells. | Auditory, olfactory, and visual inspection | No exception occurs. |
|  | Electromagnetic contactor and relay | Check whether there are vibration sounds in the workshop. | Auditory inspection | No exception occurs. |
|  |  | Check whether the contacts are in good contact. | Visual inspection | No exception occurs. |
| Control circuit | Control PCB, connector | Check whether the screws and connectors loose. | Screw them up. | No exception occurs. |
|  |  | Check whether there is unusual smell or discoloration. | Olfactory and visual inspection | No exception occurs. |
|  |  | Check whether there are cracks, damage, deformation, or rust. | Visual inspection | No exception occurs. |
|  |  | Check whether there is electrolyte leakage or deformation. | Visual inspection, and determine the service life based on the maintenance information. | No exception occurs. |

| Subject |  | Item | Method | Criterion |
| :--- | :--- | :--- | :--- | :--- |
| Cooling <br> system | Check whether there are <br> unusual sounds or vibration. | linditory and visual <br> inspection, and turn <br> the fan blades with <br> your hand. | The rotation is <br> smooth. |  |
|  | Check whether the bolts <br> loose. | Screw them up. | No exception <br> occurs. |  |
|  | Check whether there is <br> decoloration caused due to <br> overheat. | Visual inspection, <br> and determine the <br> service life based on <br> the maintenance <br> information. | No exception <br> occurs. |  |
|  | Check whether there are <br> foreign matters blocking or <br> attached to the cooling fan, <br> air inlets, or air outlets. | Visual inspection | No exception <br> occurs. |  |

For more details about maintenance, contact the local INVT office, or visit our website http://www.invt.com.cn, and choose Service and Support > Online Service.

### 8.3 Cooling fan

The service life of the cooling fan of the VFD is more than 25,000 hours. The actual service life of the cooling fan is related to the use of the VFD and the temperature in the ambient environment.

You can view the running duration of the VFD through P07.14 (Accumulated running time).
The increase of the bearing noise indicates a fan fault. If the VFD is applied in a key position, replace the fan once the fan starts to generate unusual noise. You can purchase spare parts of fans from INVT.

Cooling fan replacement

Read chapter 1 "Safety Precautions" carefully and follow the instructions to perform operations. Otherwise, physical injuries or damage to the device may be caused.

1. Stop the device, disconnect the AC power supply, and wait for a time no shorter than the waiting time designated on the VFD.
2. Open the cable clamp to loose the fan cable (for VFDs of 004G/5R5P-030G/037P, the middle casing needs to be removed).
3. Remove the fan cable.
4. Remove the fan with a screwdriver.
5. Install a new fan in the VFD in the reverse steps. Assemble the VFD. Ensure that the air direction of the fan is consistent with that of the VFD, as shown in the Figure 8-1.
6. Power on the VFD.

Figure 8-1 Fan maintenance for VFDs of 7R5G/011P or higher

### 8.4 Capacitor

### 8.4.1 Capacitor reforming

If the VFD has been left unused for a long time, you need to follow the instructions to reform the DC bus capacitor before using it. The storage time is calculated from the date the VFD is delivered.

| Storage time | Operation principle |
| :---: | :--- |
| Less than 1 year | No charging operation is required. |
| 1 to 2 years | The VFD needs to be powered on for 1 hour before the first running <br> command. |
| 2 to 3 years | Use a voltage controlled power supply to charge the VFD: <br> Charge the VFD at 25\% of the rated voltage for 30 minutes, and then <br> charge it at 50\% of the rated voltage for 30 minutes, at 75\% for another <br> 30 minutes, and finally charge it at 100\% of the rated voltage for 30 <br> minutes. |
| More than 3 years | Use a voltage controlled power supply to charge the VFD: <br> Charge the VFD at 25\% of the rated voltage for 2 hours, and then charge <br> it at 50\% of the rated voltage for 2 hours, at $75 \%$ for another 2 hours, and <br> finally charge it at $100 \%$ of the rated voltage for 2 hours. |

The method for using a voltage controlled power supply to charge the VFD is described as follows:

The selection of a voltage controlled power supply depends on the power supply of the VFD. For VFDs with an incoming voltage of $1 \mathrm{PH} / 3 \mathrm{PH} 230 \mathrm{~V}$ AC, you can use a 230 V AC/2 A voltage regulator. Both 1PH and 3PH VFDs can be charged with a 1 PH voltage controlled power supply (connect $\mathrm{L}+$ to R , and N to S or T ). All the DC bus capacitors share one rectifier, and therefore they are all charged.
For VFDs of a high voltage class, ensure that the voltage requirement (for example, 380 V ) is met during charging. Capacitor changing requires little current, and therefore you can use a
small-capacity power supply ( 2 A is sufficient).
The method for using a resistor (incandescent lamp) to charge the drive is described as follows:

If you directly connect the drive device to a power supply to charge the DC bus capacitor, it needs to be charged for a minimum of 60 minutes. The charging operation must be performed at a normal indoor temperature without load, and you must connect a resistor in series mode in the 3 PH circuit of the power supply.
For a 380 V drive device, use a resistor of $1 \mathrm{k} \Omega / 100 \mathrm{~W}$. If the voltage of the power supply is no higher than 380 V , you can also use an incandescent lamp of 100 W . If an incandescent lamp is used, it may go off or the light may become very weak.

Figure 8-2 Charging circuit example of driving devices of 380 V

### 8.4.2 Electrolytic capacitor replacement

Read 1 "Safety Precautions" carefully and follow the instructions to perform operations. Otherwise, physical injuries or damage to the device may be caused.

The electrolytic capacitor of a VFD must be replaced if it has been used for more than 35,000 hours. For details about the replacement, contact the local INVT office.

### 8.5 Power cable

Read 1 "Safety Precautions" carefully and follow the instructions to perform operations. Otherwise, physical injuries or damage to the device may be caused.

1. Stop the VFD, disconnect the power supply, and wait for a time no shorter than the waiting time designated on the VFD.
2. Check the connection of the power cables. Ensure that they are firmly connected.
3. Power on the VFD.

## 9 Communication protocol

### 9.1 What this chapter contains

This chapter describes the communication protocol of Goodrive350 IP55 high-ingress protection products.
Goodrive350 IP55 high-ingress protection VFDs provide RS485 communication interfaces and adopt the master-slave communication based on the international standard Modbus communication protocol. You can implement centralized control (setting commands for controlling the VFD, modifying the running frequency and related function code parameters, and monitoring the working state and fault information of the VFD) through PC/PLC, upper control computer, or other devices to meet specific application requirements.

### 9.2 Modbus protocol introduction

Modbus is a software protocol, a common language used in electronic controllers. By using this protocol, a controller can communicate with other devices through transmission lines. It is a general industrial standard. With this standard, control devices produced by different manufacturers can be connected to form an industrial network and be monitored in a centralized way.

The Modbus protocol provides two transmission modes, namely American Standard Code for Information Interchange (ASCII) and remote terminal units (RTU). On one Modbus network, all the device transmission modes, baud rates, data bits, check bits, end bits, and other basic parameters must be set consistently.

A Modbus network is a control network with one master and multiple slaves, that is, on one Modbus network, there is only one device serving as the master, and other devices are the slaves. The master can communicate with one slave or broadcast messages to all the slaves. For separate access commands, a slave needs to return a response. For broadcasted information, slaves do not need to return responses.

### 9.3 Application of Modbus

Goodrive350 IP55 high-ingress protection series VFDs use the RTU mode provided by the Modbus protocol, and RS485 interfaces are used.

### 9.3.1 RS485

RS485 interfaces work in half-duplex mode and transmit data signals in the differential transmission way, which is also referred to as balanced transmission. An RS485 interface uses a twisted pair, where one wire is defined as A (+), and the other B (-). Generally, if the positive electrical level between the transmission drives $A$ and $B$ ranges from +2 V to +6 V , the logic is " 1 "; and if it ranges from -2 V to -6 V , the logic is " 0 ".
The 485+ terminal on the terminal block of the VFD corresponds to A, and 485-corresponds to B.

The communication baud rate (P14.01) indicates the number of bits transmitted in a second, and the unit is bit/s (bps). A higher baud rate indicates faster transmission and poorer anti-interference capability. When a twisted pair of $0.56 \mathrm{~mm}(24 \mathrm{AWG})$ is used, the maximum transmission distance varies according to the baud rate, as described in the following table.

| Baud rate (bps) | Max. transmission <br> distance | Baud rate (bps) | Max. transmission <br> distance |
| :---: | :---: | :---: | :---: |
| 2400 | 1800 m | 9600 | 800 m |
| 4800 | 1200 m | 19200 | 600 m |

When RS485 interfaces are used for long-distance communication, it is recommended that you use shielded cables, and use the shield layer as the ground wires.

When there are fewer devices and the transmission distance is short, the whole network works well without terminal load resistors. The performance, however, degrades as the distance increases. Therefore, it is recommended that you use a $120 \Omega$ terminal resistor when the transmission distance is long.

### 9.3.1.1 Application to one VFD

Figure $9-1$ is the Modbus wiring diagram of one VFD and a PC. Generally, PCs do not provide RS485 interfaces, so you need to convert an RS232 interface or USB port of a PC to an RS485 interface. Connect end A of the RS485 interface to the 485+ port on the terminal block of the VFD, and connect end B to the 485 - port. It is recommended that you use shielded twisted pairs. When an RS232-RS485 converter is used, the cable used to connect the RS232 interface of the PC and the converter cannot be longer than 15 m . Use a short cable when possible. It is recommended that you insert the converter directly into the PC. Similarly, when a USB-RS485 converter is used, use a short cable when possible.

Figure 9-1 Wiring of RS485 applied to one VFD

### 9.3.1.2 Application to multiple VFDs

In practical application to multiple VFDs, chrysanthemum connection and star connection are commonly used.

According to the requirements of the RS485 industrial bus standards, all the devices need to be connected in chrysanthemum mode with one $120 \Omega$ terminal resistor on each end, as shown in Figure 9-2. Figure 9-3 is the simplified wiring diagram, and Figure 9-4 is the practical application diagram.

Figure 9-2 On-site chrysanthemum connection diagram

Figure 9-3 Simplified chrysanthemum connection diagram

Figure 9-4 Practical application diagram of chrysanthemum connection

Figure 9-5 shows the start connection diagram. When this connection mode is adopted, the two devices that are farthest away from each other on the line must be connected with a terminal resistor (in Figure 9-5, the two devices are devices 1\# and 15\#).

Figure 9-5 Star connection

Use shielded cable, if possible, in multi-device connection. The baud rates, data bit check settings, and other basic parameters of all the devices on the RS485 line must be set consistently, and addresses cannot be repeated.

### 9.3.2 RTU mode

### 9.3.2.1 RTU communication frame structure

When a controller is set to use the RTU communication mode on a Modbus network, every byte ( 8 bits) in the message includes 2 hexadecimal characters (each includes 4 bits). Compared with the ASCII mode, the RTU mode can transmit more data with the same baud rate.

## Code system

- 1 start bit
- 7 or 8 data bits; the minimum valid bit is transmitted first. Each frame domain of 8 bits includes 2 hexadecimal characters ( $0-9, A-F)$.
- 1 odd/even check bit; this bit is not provided if no check is needed.
- 1 end bit (with check performed), 2 bits (without check)

## Error detection domain

- Cyclic redundancy check (CRC)

The following table describes the data format.
11-bit character frame (Bits 1 to 8 are data bits)

| Start bit | BIT1 | BIT2 | BIT3 | BIT4 | BIT5 | BIT6 | BIT7 | BIT8 | Check bit | End bit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

10-bit character frame (Bits 1 to 7 are data bits)

| Start bit | BIT1 | BIT2 | BIT3 | BIT4 | BIT5 | BIT6 | BIT7 | Check bit | End bit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

In a character frame, only the data bits carry information. The start bit, check bit, and end bit are used to facilitate the transmission of the data bits to the destination device. In practical applications, you must set the data bits, parity check bits, and end bits consistently.
In RTU mode, the transmission of a new frame always starts from an idle time (the transmission time of 3.5 bytes). On a network where the transmission rate is calculated based
on the baud rate, the transmission time of 3.5 bytes can be easily obtained. After the idle time ends, the data domains are transmitted in the following sequence: slave address, operation command code, data, and CRC check character. Each byte transmitted in each domain includes 2 hexadecimal characters ( $0-9$, A-F). The network devices always monitor the communication bus. After receiving the first domain (address information), each network device identifies the byte. After the last byte is transmitted, a similar transmission interval (the transmission time of 3.5 bytes) is used to indicate that the transmission of the frame ends. Then, the transmission of a new frame starts.

## RTU data frame format

The information of a frame must be transmitted in a continuous data flow. If there is an interval greater than the transmission time of 1.5 bytes before the transmission of the entire frame is complete, the receiving device deletes the incomplete information, and mistakes the subsequent byte for the address domain of a new frame. Similarly, if the transmission interval between two frames is shorter than the transmission time of 3.5 bytes, the receiving device mistakes it for the data of the last frame. The CRC check value is incorrect due to the disorder of the frames, and thus a communication fault occurs.

The following table describes the standard structure of an RTU frame.

| START (frame header) | T1-T2-T3-T4 (transmission time of 3.5 bytes) |  |  |
| :---: | :---: | :---: | :---: |
| ADDR (slave address domain) | Communication address: 0-247 (decimal system) (0 is the <br> broadcast address) |  |  |
| CMD (function domain) | 03H: read slave parameters <br> 06H: write slave parameters |  |  |
| DATA (N-1) <br> $\ldots$ <br> DATA ( 0 ) <br> (data domain) | Data of $2 \times \mathrm{N}$ bytes, main content of the communication as well <br> as the core of data exchanging |  |  |
| CRC CHK (LSBs) | Detection value: CRC (16 bits) |  |  |
| CRC CHK high bit (MSBs) | T1-T2-T3-T4 (transmission time of 3.5 bytes) |  |  |
| END (frame tail) |  |  |  |

### 9.3.2.2 RTU communication frame error check modes

During the transmission of data, errors may occur due to various factors. Without check, the data receiving device cannot identify data errors and may make a wrong response. The wrong response may cause severe problems. Therefore, the data must be checked.

The check is implemented as follows: The transmitter calculates the to-be-transmitted data based on a specific algorithm to obtain a result, adds the result to the rear of the message, and transmits them together. After receiving the message, the receiver calculates the data based on the same algorithm to obtain a result, and compares the result with that transmitted by the transmitter. If the results are the same, the message is correct. Otherwise, the message is considered wrong.

The error check of a frame includes two parts, namely, bit check on individual bytes (that is, odd/even check using the check bit in the character frame), and whole data check (CRC check).

## Bit check on individual bytes (odd/even check)

You can select the bit check mode as required, or you can choose not to perform the check, which will affect the check bit setting of each byte.
Definition of even check: Before the data is transmitted, an even check bit is added to indicate whether the number of " 1 " in the to-be-transmitted data is odd or even. If it is even, the check bit is set to " 0 "; and if it is odd, the check bit is set to " 1 ".
Definition of odd check: Before the data is transmitted, an odd check bit is added to indicate whether the number of " 1 " in the to-be-transmitted data is odd or even. If it is odd, the check bit is set to " 0 "; and if it is even, the check bit is set to "1".
For example, the data bits to be transmitted are "11001110", including five "1". If the even check is applied, the even check bit is set to "1"; and if the odd check is applied, the odd check bit is set to " 0 ". During the transmission of the data, the odd/even check bit is calculated and placed in the check bit of the frame. The receiving device performs the odd/even check after receiving the data. If it finds that the odd/even parity of the data is inconsistent with the preset information, it determines that a communication error occurs.

## CRC check mode

A frame in the RTU format includes an error detection domain based on the CRC calculation. The CRC domain checks all the content of the frame. The CRC domain consists of two bytes, including 16 binary bits. It is calculated by the transmitter and added to the frame. The receiver calculates the CRC of the received frame, and compares the result with the value in the received CRC domain. If the two CRC values are not equal to each other, errors occur in the transmission.

During CRC, 0xFFFF is stored first, and then a process is invoked to process a minimum of 6 contiguous bytes in the frame based on the content in the current register. CRC is valid only for the 8-bit data in each character. It is invalid for the start, end, and check bits.

During the generation of the CRC values, the "exclusive or" (XOR) operation is performed on the each 8 -bit character and the content in the register. The result is placed in the bits from the least significant bit (LSB) to the most significant bit (MSB), and 0 is placed in the MSB. Then, LSB is detected. If LSB is 1 , the XOR operation is performed on the current value in the register and the preset value. If LSB is 0 , no operation is performed. This process is repeated 8 times. After the last bit ( $8^{\text {th }}$ bit) is detected and processed, the XOR operation is performed on the next 8 -bit byte and the current content in the register. The final values in the register are the CRC values obtained after operations are performed on all the bytes in the frame.

The calculation adopts the international standard CRC check rule. You can refer to the related standard CRC algorithm to compile the CRC calculation program as required.
The following is a simple CRC calculation function for your reference (using the C programming language):

```
unsigned int crc_cal_value(unsigned char×data_value,unsigned char
data_length)
{
    int i;
```

```
    unsigned int crc_value=0xffff;
    while(data_length--)
    {
        crc_value^=xdata_value++;
        for(i=0;i<8;i++)
        {
        if(crc_value&0x0001)
            crc_value=(crc_value>>1)^0xa001;
        else
            crc_value=crc_value>>1;
    }
    }
    return(crc_value);
}
```

In the ladder logic, CKSM uses the table look-up method to calculate the CRC value according to the content in the frame. The program of this method is simple, and the calculation is fast, but the ROM space occupied is large. Use this program with caution in scenarios where there are space occupation limits on programs.

### 9.4 RTU command code and communication data

### 9.4.1 Command code: 03 H , reading N words

## Continuously reading a maximum of $\mathbf{1 6}$ words

The command code 03 H is used by the master to read data from the VFD. The quantity of data to be read depends on the "data quantity" in the command. A maximum of 16 pieces of data can be read. The addresses of the read parameters must be contiguous. Each piece of data occupies 2 bytes, that is, one word. The command format is presented using the hexadecimal system (a number followed by " H " indicates a hexadecimal value). One hexadecimal value occupies one byte.
The 03 H command is used to read information including the parameters and operation state of the VFD.
For example, starting from the data address of 0004 H , to read two contiguous pieces of data (that is, to read content from the data addresses 0004 H and 0005 H ), the structure of the frame is described in the following table.
RTU master command (transmitted by the master to the VFD)

| START | T1-T2-T3-T4 (transmission time of 3.5 bytes) |
| :---: | :---: |
| ADDR (address) | 01 H |
| CMD (command code) | 03 H |
| Most significant byte (MSB) of the start address | 00 H |
| Least significant byte (LSB) of the start address | 04 H |
| MSB of data quantity | 00 H |
| LSB of data quantity | 02 H |
| LSB of CRC | 85 H |
| MSB of CRC | CAH |
| END | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

The value in START and END is "T1-T2-T3-T4 (transmission time of 3.5 bytes)", indicating that the RS485 needs to stay idle for at least the transmission time of 3.5 bytes. An idle time is required to distinguish on message from another to ensure that the two messages are not regarded as one.
The value of ADDR is 01 H , indicating that the command is transmitted to the VFD whose address is 01 H . The ADDR information occupies one byte.
The value of CMD is 03 H , indicating that the command is used to read data from the VFD. The CMD information occupies one byte.
"Start address" indicates that data reading is started from this address. It occupies two bytes, with the MSB on the left and LSB on the right.
"Data quantity" indicates the quantity of data to be read (unit: word).
The value of "Start address" is 0004 H , and that of "Data quantity" is 0002 H , indicating that data is to be read from the data addresses of 0004 H and 0005 H .
CRC check occupies two bytes, with the LSB on the left, and MSB on the right.
RTU slave response (transmitted by the VFD to the master)

| START | T1-T2-T3-T4 (transmission time of 3.5 bytes) |
| :---: | :---: |
| ADDR | 01 H |
| CMD | 03 H |
| Number of bytes | 04 H |
| MSB of data in 0004H | 13 H |
| LSB of data in 0004H | 88 H |
| MSB of data in 0005H | 00 H |
| LSB of data in 0005H | 00 H |
| LSB of CRC | 7 HH |
| MSB of CRC | $9 D \mathrm{H}$ |
| END | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

The definition of the response information is described as follows:
The value of ADDR is 01 H , indicating that the message is transmitted by the VFD whose address is 01 H . The ADDR information occupies one byte.

The value of CMD is 03 H , indicating that the message is a response of the VFD to the 03 H command of the master for reading data. The CMD information occupies one byte.
"Number of bytes" indicates the number of bytes between a byte (not included) and the CRC byte (not included). The value 04 indicates that there are four bytes of data between "Number of bytes" and "LSB of CRC", that is, "MSB of data in 0004H", "LSB of data in 0004H", "MSB of data in 0005 H ", and "LSB of data in 0005 H ".

A piece of data is two bytes, with the MSB on the left and LSB on the right. From the response, we can see that the data in 0004 H is 1388 H , and that in 0005 H is 0000 H .

CRC check occupies two bytes, with the LSB on the left, and MSB on the right.

### 9.4.2 Command code: 06 H , writing a word

This command is used by the master to write data to the VFD. One command can be used to write only one piece of data. It is used to modify the parameters and operation mode of the

VFD.
For example, to write $5000(1388 \mathrm{H})$ to 0004 H of the VFD whose address is 02 H , the structure of the frame is described in the following table.
RTU master command (transmitted by the master to the VFD)

| START | T1-T2-T3-T4 (transmission time of 3.5 bytes) |
| :---: | :---: |
| ADDR | 02 H |
| CMD | 06 H |
| MSB of data writing address | 00 H |
| LSB of data writing address | 04 H |
| MSB of to-be-written data | 13 H |
| LSB of to-be-written data | 88 H |
| LSB of CRC | C5H |
| MSB of CRC | 6 HH |
| END | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

RTU slave response (transmitted by the VFD to the master)

| START | T1-T2-T3-T4 (transmission time of 3.5 bytes) |
| :---: | :---: |
| ADDR | 02 H |
| CMD | 06 H |
| MSB of data writing address | 00 H |
| LSB of data writing address | 04 H |
| MSB of to-be-written data | 13 H |
| LSB of to-be-written data | 88 H |
| LSB of CRC | C5H |
| MSB of CRC | 6 HH |
| END | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

Note: The sections 9.4.1 and 9.4.2 mainly describe the command formats. For the detailed application, see the examples in section 9.4.8 "Read/Write operation example".

### 9.4.3 Command code: 08 H , diagnosis

Sub-function code description

| Sub-function code | Description |
| :---: | :---: |
| 0000 | Return data based on query requests |

For example, to query about the circuit detection information about the VFD whose address is 01 H , the query and return strings are the same, and the format is described in the following tables.

RTU master command

| START | T1-T2-T3-T4 (transmission time of 3.5 bytes) |
| :---: | :---: |
| ADDR | 01 H |
| CMD | 08 H |
| MSB of the sub-function code | 00 H |
| LSB of the sub-function code | 00 H |
| MSB of data | 12 H |

| LSB of data | ABH |
| :---: | :---: |
| LSB of CRC CHK | ADH |
| MSB of CRC CHK | 14 H |
| END | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

RTU slave response

| START | T1-T2-T3-T4 (transmission time of 3.5 bytes) |
| :---: | :---: |
| ADDR | 01 H |
| CMD | 08 H |
| MSB of the sub-function code | 00 H |
| LSB of the sub-function code | 00 H |
| MSB of data | 12 H |
| LSB of data | ABH |
| LSB of CRC CHK | ADH |
| MSB of CRC CHK | 14 H |
| END | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

### 9.4.4 Command code: 10 H , continuous writing

The command code 10 H is used by the master to write data to the VFD. The quantity of data to be written is determined by "Data quantity", and a maximum of 16 pieces of data can be written.

For example, to write $5000(1388 \mathrm{H})$ and $50(0032 \mathrm{H})$ respectively to 0004 H and 0005 H of the VFD whose slave address is 02 H , the structure of the frame is described in the following table.
RTU master command (transmitted by the master to the VFD)

| START | T1-T2-T3-T4 (transmission time of 3.5 bytes) |
| :---: | :---: |
| ADDR | 02 H |
| CMD | 10 H |
| MSB of data writing address | 00 H |
| LSB of data writing address | 04 H |
| MSB of data quantity | 00 H |
| LSB of data quantity | 02 H |
| Number of bytes | 04 H |
| MSB of data to be written to 0004H | 13 H |
| LSB of data to be written to 0004H | 88 H |
| MSB of data to be written to 0005H | 00 H |
| LSB of data to be written to 0005H | 32 H |
| LSB of CRC | C5H |
| MSB of CRC | 6 HH |
| END | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

RTU slave response (transmitted by the VFD to the master)

| START | T1-T2-T3-T4 (transmission time of 3.5 bytes) |
| :---: | :---: |
| ADDR | 02 H |
| CMD | 10 H |
| MSB of data writing address | 00 H |
| LSB of data writing address | 04 H |

| MSB of data quantity | 00 H |
| :---: | :---: |
| LSB of data quantity | 02 H |
| LSB of CRC | C5H |
| MSB of CRC | 6 EH |
| END | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

### 9.4.5 Data address definition

This section describes the address definition of communication data. The addresses are used for controlling the running, obtaining the state information, and setting related function parameters of the VFD.

### 9.4.5.1 Function code address representation rules

The address of a function code consists of two bytes, with the MSB on the left and LSB on the right. The MSB ranges from 00 to ffH , and the LSB also ranges from 00 to ffH. The MSB is the hexadecimal form of the group number before the dot mark, and LSB is that of the number behind the dot mark. Take P05.06 as an example, the group number is 05 , that is, the MSB of the parameter address is the hexadecimal form of 05 ; and the number behind the dot mark is 06 , that is, the LSB is the hexadecimal form of 06 . Therefore, the function code address is 0506 H in the hexadecimal form. For P10.01, the parameter address is 0 A 01 H .

| Function <br> code | Name | Description | Setting <br> range | Default <br> value | Modify |
| :---: | :---: | :--- | :---: | :---: | :---: |
| P10.00 | Simple PLC <br> mode | 0: Stop after running once <br> 1: Keep running in the final value after <br> running once <br> 2: Cyclic running | $0-2$ | 0 | 0 |
| P10.01 | Simple PLC <br> memory selection | 0: No memory after power down <br> 1: Memory after power down | $0-1$ | 0 | 0 |

## Note:

1. The parameters in the P99 group are set by the manufacturer. They cannot be read or modified. Some parameters cannot be modified when the VFD is running; some cannot be modified regardless of the state of the VFD. Pay attention to the setting range, unit, and related description of a parameter when modifying it.
2. The service life of the Electrically Erasable Programmable Read-Only Memory (EEPROM) may be reduced if it is frequently used for storage. For users, some function codes do not need to be stored during communication. The application requirements can be met by modifying the value of the on-chip RAM, that is, modifying the MSB of the corresponding function code address from 0 to 1 . For example, if P00.07 is not to be stored in the EEPROM, you need only to modify the value of the RAM, that is, set the address to 8007 H . The address can be used only for writing data to the on-chip RAM, and it is invalid when used for reading data.

### 9.4.5.2 Description of other function code addresses

In addition to modifying the parameters of the VFD, the master can also control the VFD, such as start and stop it, and monitor the operation state of the VFD. The following table describes other function parameters.

| Function | Address | Data description | R/W |
| :---: | :---: | :---: | :---: |
| Communication-based | 2000 H | 0001H: Forward running | R/W |

| Function | Address | Data description | R/W |
| :---: | :---: | :---: | :---: |
| control command |  | 0002H: Reverse running |  |
|  |  | 0003H: Forward jogging |  |
|  |  | 0004H: Reverse jogging |  |
|  |  | 0005H: Stop |  |
|  |  | 0006H: Coast to stop |  |
|  |  | 0007H: Fault reset |  |
|  |  | 0008H: Jogging to stop |  |
| Communication-based value setting | 2001H | Communication-based frequency setting (0-Fmax, unit: 0.01 Hz ) | R/W |
|  | 2002H | PID setting, range (0-1000, 1000 corresponding to 100.0\%) |  |
|  | 2003H | PID feedback, range (0-1000, 1000 corresponding to 100.0\%) | R/W |
|  | 2004H | Torque setting (-3000-+3000, 1000 corresponding to $100.0 \%$ of the rated current of the motor) | R/W |
|  | 2005H | Setting of the upper limit of the forward running frequency (0-Fmax, unit: 0.01 Hz ) | R/W |
|  | 2006H | Setting of the upper limit of the reverse running frequency (0-Fmax, unit: 0.01 Hz ) | R/W |
|  | 2007H | Upper limit of the electromotion torque (0-3000, 1000 corresponding to $100.0 \%$ of the rated current of the VFD) | R/W |

| Identification code | 3016 H | $/$ |  | R |  |  |  |
| Fault code | 5000 H | $/$ | R |  |  |  |  |

The Read/Write (R/W) characteristics indicate whether a function can be read and written. For example, "Communication-based control command" can be written, and therefore the command code 6 H is used to control the VFD. The R characteristic indicates that a function can only be read, and W indicates that a function can only be written.
Note: Some parameters in the preceding table are valid only after they are enabled. Take the running and stop operations as examples, you need to set "Running command channel" (P00.01) to "Communication", and set "Communication running command channel" (P00.02) to the Modbus/Modbus TCP communication channel. For another example, when modifying "PID setting", you need to set "PID reference source" (P09.00) to Modbus communication.

The following table describes the encoding rules of device codes (corresponding to the identification code 2103H of the VFD).

| 8 MSBs | Meaning | 8 LSBs | Meaning |
| :---: | :---: | :---: | :---: |
| $0 \times 01$ |  |  | $0 \times 08$ |
|  |  |  | GD35 vector VFD |
|  |  |  | GD35-H1 vector VFD |
|  |  | $0 \times a 0$ | GD300 vector VFD |

### 9.4.6 Fieldbus scale

In practical applications, communication data is represented in the hexadecimal form, but hexadecimal values cannot represent decimals. For example, 50.12 Hz cannot be represented in the hexadecimal form. In such cases, we can multiply 50.12 by 100 to obtain an integer 5012, and then 50.12 can be represented as 1394 H ( 5012 in the decimal form) in the hexadecimal form.
In the process of multiplying a non-integer by a multiple to obtain an integer, the multiple is referred to as a fieldbus scale.

The fieldbus scale depends on the number of decimals in the value specified in "Description" or "Default value". If there are $n$ decimals in the value, the fieldbus scale $m$ is the power $n$ of 10 . Take the following table as an example, m is 10 .

| Function <br> code | Name | Description | Default <br> value | Modify |
| :---: | :---: | :--- | :---: | :---: |
| P01.20 | Wake-up-from-sleep delay | $0.0-3600.0 s$ (valid when the ones place <br> of P01.19 is 2) | 0.0 s | 0 |
| P01.21 | Restart after power cut | 0: Restart is disabled <br> $1:$ Restart is enabled | 0 | 0 |

The value specified in "Description" or "Default value" contains one decimal, so the fieldbus scale is 10 . If the value received by the upper computer is 50 , the value of
"Wake-up-from-sleep delay" of the VFD is 5.0 ( $5.0=50 / 10$ ).
To set the "Wake-up-from-sleep delay" to 5.0 s through Modbus communication, you need first to multiply 5.0 by 10 according to the scale to obtain an integer 50 , that is, 32 H in the hexadecimal form, and then transmit the following write command:

| 01 | 06 | 0114 | 0032 | 9 E7 |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { FD } \\ & \text { ress } \end{aligned}$ | Write command | Parameter address | Parameter data |  |

After receiving the command, the VFD converts 50 into 5.0 based on the fieldbus scale, and then sets "Wake-up-from-sleep delay" to 5.0 s.
For another example, after the upper computer transmits the "Wake-up-from-sleep delay" parameter read command, the master receives the following response from the VFD:

The parameter data is 0032 H , that is, 50 , so 5.0 is obtained based on the fieldbus scale ( $50 / 10=5.0$ ). In this case, the master identifies that the "Wake-up-from-sleep delay" is 5.0 s .

### 9.4.7 Error message response

Operation errors may occur in communication-based control. For example, some parameters can only be read, but a write command is transmitted. In this case, the VFD returns an error message response.
Error message responses are transmitted by the VFD to the master. The following table describes the codes and definitions of the error message responses.

| Code | Name | Definition |
| :---: | :---: | :--- |
| 01 H | Invalid <br> command | The command code received by the upper computer is not allowed to be <br> executed. The possible causes are as follows: <br> - The function code is applicable only on new devices and is not <br> implemented on this device. <br> - The slave is in the faulty state when processing this request. |
| 02 H | Invalid data <br> address | For the VFD, the data address in the request of the upper computer is not <br> allowed. In particular, the combination of the register address and the <br> number of the to-be-transmitted bytes is invalid. |
| 03 H | Invalid data <br> bit | The received data domain contains a value that is not allowed. The value <br> indicates the error of the remaining structure in the combined request. <br> Note: It does not mean that the data item submitted for storage in the <br> register includes a value unexpected by the program. |
| 04 H | Operation <br> failure | The parameter is set to an invalid value in the write operation. For <br> example, a function input terminal cannot be set repeatedly. |
| 05 H | Password <br> error | The password entered in the password verification address is different <br> from that set in P07.00. |
| 06 H | Data frame <br> error | The length of the data frame transmitted by the upper computer is <br> incorrect, or in the RTU format, the value of the CRC check bit is |

| Code | Name | Definition |
| :---: | :---: | :--- |
|  |  | inconsistent with the CRC value calculated by the lower computer |
| 07 H | Parameter <br> read-only | The parameter to be modified in the write operation of the upper computer <br> is a read-only parameter. |
| 08 H | Parameter <br> cannot be <br> modified in <br> running | The parameter to be modified in the write operation of the upper computer <br> cannot be modified during the running of the VFD. |
| 09 H | Password <br> protection | A user password is set, and the upper computer does not provide the <br> password to unlock the system when performing a read or write operation. <br> The error of "system locked" is reported. |

When returning a response, the device uses a function code domain and fault address to indicate whether it is a normal response (no error) or exception response (some errors occur). In a normal response, the device returns the corresponding function code and data address or sub-function code. In an exception response, the device returns a code that is equal to a normal code, but the first bit is logic 1.
For example, if the master device transmits a request message to a slave device for reading a group of function code address data, the code is generated as follows:

$$
00000011 \text { (03H in the hexadecimal form) }
$$

For a normal response, the same code is returned.
For an exception response, the following code is returned:
10000011 ( 83 H in the hexadecimal form)
In addition to the modification of the code, the slave returns a byte of exception code that describes the cause of the exception. After receiving the exception response, the typical processing of the master device is to transmit the request message again or modify the command based on the fault information.

For example, to set the "Running command channel" (P00.01, the parameter address is 0001 H ) of the VFD whose address is 01 H to 03 , the command is as follows:

But the setting range of the "Running command channel" is 0 to 2 . The value 3 exceeds the setting range. In this case, the VFD returns an error message response as shown in the following:

The exception response code 86 H (generated based on the MSB "1" of the write command 06 H ) indicates that it is an exception response to the write command ( 06 H ). The error code is 04 H . From the preceding table, we can see that it indicates the error "Operation failure", which means "The parameter is set to an invalid value in the write operation".

### 9.4.8 Read/Write operation example

For the formats of the read and write commands, see sections 9.4.1 and 9.4.2.

### 9.4.8.1 Read command 03H examples

Example 1: Read state word 1 of the VFD whose address is 01 H . From the table of other function parameters, we can see that the parameter address of state word 1 of the VFD is 2100 H .

The read command transmitted to the VFD is as follows:

| 01 | 03 | 2100 | 0001 | 8E 36 |
| :---: | :---: | :---: | :---: | :---: |
| VFD address | Read command | Parameter address | Data quantity | CRC |

Assume that the following response is returned:

| 01 | $\underline{03}$ | $\underline{02}$ | $\underline{0003}$ | F8 45 |
| :--- | :--- | :--- | :--- | :--- |
| RFD <br> address | Read <br> command <br> of bytes | Data content |  |  |

The data content returned by the VFD is 0003 H , which indicates that the VFD is in the stopped state.

Example 2: View information about the VFD whose address is 03H, including "Type of current fault" (P07.27) to "Type of last but four fault" (P07.32) of which the parameter addresses are 071 BH to 0720 H (contiguous 6 parameter addresses starting from 071BH).
The command transmitted to the VFD is as follows:

| 03 | 03 | 071 B | 0006 | B5 59 |
| :---: | :---: | :---: | :---: | :---: |
| VFD address | Read command | Start address | 6 parameters in total | CRC |

Assume that the following response is returned:

From the returned data, we can see that all the fault types are 0023 H , that is, 35 in the decimal form, which means the maladjustment fault (STo)

### 9.4.8.2 Write command 06H examples

Example 1: Set the VFD whose address is 03 H to be forward running. Refer to the table of other function parameters, the address of "Communication-based control command" is 2000 H , and 0001 H indicates forward running, as shown in the following figure.

| Function | Address | Data description | R/W |
| :---: | :---: | :--- | :---: |
| Communication-based <br> control command | 2000 H | $0001 \mathrm{H}:$ Forward running | R/W |
|  |  | $0002 \mathrm{H}:$ Reverse running |  |

| Function | Address | Data description | R/W |
| :---: | :---: | :---: | :---: |
|  |  | 0003H: Forward jogging |  |
|  |  | 0004H: Reverse jogging |  |
|  |  | 0005H: Stop |  |
|  |  | 0006H: Coast to stop |  |
|  |  | 0007H: Fault reset |  |
|  |  | 0008H: Jogging to stop |  |

The command transmitted by the master is as follows:

If the operation is successful, the following response is returned (same as the command transmitted by the master):

| $\frac{03}{\text { VFD }}$address | $\frac{06}{$ Write  <br>  command } | $\frac{2000}{$ Parameter  <br>  address } | $\frac{0001}{} \quad$Forward <br> running | 4208 |
| :--- | :--- | :--- | :--- | :--- |
| CRC |  |  |  |  |

Example 2: Set the "Max. output frequency" of the VFD whose address is 03 H to 100 Hz .

| Function <br> code | Name | Description | Default <br> value | Modify |
| :---: | :---: | :--- | :---: | :---: |
| P00.03 | Max. output <br> frequency | Used to set the max. output frequency of the VFD. <br> lt is the basis of frequency setup and the <br> acceleration/deceleration. <br> Setting range: Max (P00.04, 10.00) -630.00 Hz | 50.00 Hz | 0 |

From the number of decimals, we can see that the fieldbus scale of the "Max. output frequency" (P00.03) is 100 . Multiply 100 Hz by 100. The value 10000 is obtained, and it is 2710 H in the hexadecimal form.
The command transmitted by the master is as follows:

$\frac{03}{\frac{03}{$|  VFD  |
| :---: |
|  address  |}}$\frac{\mathbf{0 6}}{$|  Write  |
| :---: |
|  command  |}$\quad \frac{0003}{$|  Parameter  |
| :---: |
|  address  |}$\quad \frac{\mathbf{2 7 1 0}}{$|  Parameter  |
| :---: |
|  data  |}$\quad \underline{6214}$

If the operation is successful, the following response is returned (same as the command transmitted by the master):

| 03 | 06 | 0003 | 2710 | 6214 |
| :---: | :---: | :---: | :---: | :---: |
| VFD address | Write command | Paramete address | Parameter | CR |

Note: In the preceding command description, spaces are added to a command just for explanatory purposes. In practical applications, no space is required in the commands.

### 9.4.8.3 Continuously write command 10H examples

Example 1: Set the VFD whose address is 01 H to be forward running at the frequency of 10 Hz .
Refer to the table of other function parameters, the address of "Communication-based control command" is $2000 \mathrm{H}, 0001 \mathrm{H}$ indicates forward running, and the address of "Communication-based value setting" is 2001 H , as shown in the following figure. 10 Hz is 03 E 8 H in the hexadecimal form.

| Function | Address | Data description | R/W |
| :---: | :---: | :---: | :---: |
| Communication-based control command | 2000H | 0001H: Forward running | R/W |
|  |  | 0002H: Reverse running |  |
|  |  | 0003H: Forward jogging |  |
|  |  | 0004H: Reverse jogging |  |
|  |  | 0005H: Stop |  |
|  |  | 0006H: Coast to stop |  |
|  |  | 0007H: Fault reset |  |
|  |  | 0008H: Jogging to stop |  |
| Communication-based value setting | 2001H | Communication-based frequency setting (0-Fmax, unit: 0.01 Hz ) | R/W |
|  | 2002H | PID setting, range (0-1000, 1000 corresponding to $100.0 \%$ ) |  |

In the actual operation, set P00.01 to 2 and P00.06 to 8 .
The command transmitted by the master is as follows:

If the operation is successful, the following response is returned:

Example 2: Set "Acceleration time" of the VFD whose address is 01 H to 10 s , and "Deceleration time" to 20s.

| Function <br> code | Name | Description | Default value | Modify |
| :---: | :---: | :--- | :---: | :---: |
| P00.11 | Acceleration time 1 | Setting range of P00.11 and P00.12: | Model depended | $\bigcirc$ |
|  | P00.12 | Deceleration time 1 | $0.0-3600.0 \mathrm{~s}$ | Model depended |

The address of P 00.11 is $000 \mathrm{~B}, 10 \mathrm{~s}$ is 0064 H in the hexadecimal form, and 20 s is 00 C 8 H in the hexadecimal form.

The command transmitted by the master is as follows:

If the operation is successful, the following response is returned:

Note: In the preceding command description, spaces are added to a command just for explanatory purposes. In practical applications, no space is required in the commands.

### 9.4.8.4 Modbus communication commissioning example

A PC is used as the host, an RS232-RS485 converter is used for signal conversion, and the PC serial port used by the converter is COM1 (an RS232 port). The upper computer commissioning software is the serial port commissioning assistant Commix, which can be downloaded from the Internet. Download a version that can automatically execute the CRC check function. The following figure shows the interface of Commix.

First, set the serial port to COM1. Then, set the baud rate consistently with P14.01. The data bits, check bits, and end bits must be set consistently with P14.02. If the RTU mode is selected, you need to select the hexadecimal form Input HEX. To set the software to automatically execute the CRC function, you need to select ModbusRTU, select CRC16 (MODBU SRTU), and set the start byte to $\mathbf{1}$. After the auto CRC check function is enabled, do not enter CRC information in commands. Otherwise, command errors may occur due to repeated CRC check.

The commissioning command to set the VFD whose address is 03 H to be forward running is as follows:

| 0 | 06 | 000 | 0 |  |
| :---: | :---: | :---: | :---: | :---: |
| VFD | Write | Parameter address | ar | CRC |

## Note:

1. Set the address (P14.00) of the VFD to 03.
2. Set "Channel of running commands" (P00.01) to "Communication", and set "Communication channel of running commands" (P00.02) to the Modbus/Modbus TCP communication channel.
3. Click Send. If the line configuration and settings are correct, a response transmitted by the VFD is received as follows:

### 9.5 Common communication faults

Common communication faults include the following:

1. No response is returned.
2. The VFD returns an exception response.

Possible causes of no response include the following:

1. The serial port is set incorrectly. For example, the converter uses the serial port COM1, but COM2 is selected for the communication.
2. The settings of the baud rates, data bits, end bits, and check bits are inconsistent with those set on the VFD.
3. The positive pole (+) and negative pole (-) of the RS485 bus are connected reversely.
4. The resistor connected to 485 terminals on the terminal block of the VFD is set incorrectly.

The following table describes expansion cards that the VFD supports. The expansion cards are optional and need to be purchased separately.

| Name | Model | Specification |
| :---: | :---: | :--- |
| IO expansion card | EC-IO501-00 | $\bullet$ 4 digital inputs <br> $\bullet 1$ digital output |

| Name | Model | Specification |
| :---: | :---: | :---: |
|  |  | - 1 analog input <br> - 1 analog output <br> - 2 relay outputs: 1 double-contact output, and 1 single-contact output |
| IO expansion card 2 | EC-IO502-00 | - 4 digital inputs <br> - 1 PT100 <br> - 1 PT1000 <br> - 2 relay outputs: single-contact output |
| Programmable expansion card | EC-PC502-00 | - Adopting the global mainstream development environment PLC, supporting multiple types of programming languages, such as the instruction language, structural text, function block diagram, ladder diagram, continuous function chart, and sequential function chart <br> - Supporting breakpoint commissioning and periodic task run mode selection <br> - Providing user program storage space of 16 K steps, and data storage space of 8 K words <br> - 6 digital inputs <br> - 2 relay outputs <br> - 1 Al and 1 AO <br> - 1 RS485 communication channel, supporting the host controller to switch the master/slave <br> - Saving data of 1 K words at power down |
| Bluetooth communication card | $\begin{aligned} & \text { EC-TX501-1 } \\ & \text { EC-TX501-2 } \end{aligned}$ | - Supporting Bluetooth 4.0 <br> - With INVT's mobile phone APP, you can set the parameters and monitor the states of the VFD through Bluetooth <br> - The maximum communication distance in open environments is 30 m . <br> - EC-TX501-1 is equipped with a built-in antenna and applicable to molded case machines. <br> - EC-TX501-2 is configured with an external sucker antenna and applicable to sheet metal machines. |
| WIFI communication card | $\begin{aligned} & \text { EC-TX502-1 } \\ & \text { EC-TX502-2 } \end{aligned}$ | - Meeting IEEE802.11b/g/n <br> - With INVT's mobile phone APP, you can monitor the VFD locally or remotely through WIFI communication <br> - The maximum communication distance in open environments is 30 m . <br> - EC-TX501-1 is equipped with a built-in antenna and applicable to molded case machines. <br> - EC-TX501-2 is configured with an external sucker antenna and applicable to sheetmetal machines. |

| Name | Model | Specification |
| :---: | :---: | :---: |
| PROFIBUS-DP communication card | EC-TX503 | Supporting the PROFIBUS-DP protocol |
| Ethernet communication card | EC-TX504 | - Supporting Ethernet communication with INVT's internal protocol <br> - CAN be used in combination with INVT's upper computer monitoring software INVT Workshop |
| CAN multi-protocol communication card | EC-TX505C | - Based on the CAN2.0A and CAN2.0B physical layer <br> - Supporting the CANopen protocol <br> - Adopting INVT's master-slave control proprietary protocol |
| PROFINET communication card | EC-TX509 | Supporting the PROFINET protocol |
| Ethernet/IP communication card | EC-TX510 | - Supporting the Ethernet IP protocol and ODVA protocol <br> - With two Ethernet IP ports, supporting 10/100M halfffull duplex operating <br> - Supporting star, line, and ring network topologies (but not supporting ring network monitoring) |
| Modbus TCP communication card | EC-TX515 | - With two Modbus TCP IO ports, supporting 100M full duplex operating, and supporting line and star network topologies, with the nodes up to 32 <br> - Able to function as a Modbus TCP slave |
| Sin/Cos PG card | EC-PG502 | - Applicable to $\mathrm{Sin} / \mathrm{Cos}$ encoders with or without CD signals <br> - Supporting A, B, Z frequency-divided output <br> - Supporting input of pulse train reference |
| UVW incremental PG card | EC-PG503-05 | - Applicable to 5 V differential encoders <br> - Supporting A, B, Z orthogonal input <br> - Supporting U, V, W 3PH pulse input <br> - Supporting A, B, Z frequency-divided output <br> - Supporting input of pulse train reference |
| Resolver PG card | EC-PG504-00 | - Applicable to resolver encoders <br> - Supporting simulated $A, B, Z$ frequency-divided output of resolvers <br> - Supporting input of pulse train reference |
| Multi-function incremental PG card | EC-PG505-12 | - Applicable to OC encoders of 5 V or 12 V <br> - Applicable to push-pull encoders of 5 V or 12 V <br> - Applicable to differential encoders of 5 V <br> - Supporting the orthogonal input of $A, B$, and $Z$ <br> - Supporting the frequency-divided output of A, B, and Z <br> - Supporting pulse train setting |

| Name | Model | Specification |
| :---: | :---: | :---: |
| 24 V incremental PG card | EC-PG505-24B | - Applicable to 24 V OC encoders <br> - Applicable to 24 V push-pull encoders <br> - Supporting A, B, Z orthogonal input <br> - Supporting A, B, Z frequency-divided output <br> - Supporting pulse train reference input |
| Simple incremental PG card | EC-PG507-12 | - Applicable to 5 V or 12 V OC encoders <br> - Applicable to 5 V or 12 V push-pull encoders <br> - Applicable to 5 V differential encoders |
| 24 V simplified incremental PG card | EC-PG507-24 | - Applicable to 24 V OC encoders <br> - Applicable to 24 V push-pull encoders <br> - Applicable to 24 V differential encoders |
| GPRS card | EC-IC501-2 | - Supporting loT monitoring <br> - Supporting remote VFD upgrade |
| 4G card | $\begin{aligned} & \text { EC-IC502-2-CN } \\ & \text { EC-IC502-2-EU } \\ & \text { EC-IC502-2-LA } \end{aligned}$ | - Supporting standard RS485 interfaces <br> - Supporting 4G communication |

Remarks: Contact us for details about the EtherCAT communication card, 24 V power supply card, and the shockproof GPRS card with high-precision GPS positioning.

## A. 2 Dimensions and installation

All expansion cards are of the same dimensions ( $108 \mathrm{~mm} \times 39 \mathrm{~mm}$ ) and can be installed in the same way.

Follow the following operation principles when installing or removing an expansion card:

1. Ensure that no power is applied before installing the expansion card.
2. The expansion card can be installed in any one of the SLOT1, SLOT2, and SLOT3 card slots.
3. The product can be configured with three expansion cards.
4. If interference occurs on the external wires after expansion cards are installed, change their installation card slots flexibly to facilitate the wiring. For example, the connector of the connection cable of the DP card is large, so it is recommended to be installed in the SLOT1 card slot.
5. To ensure high anti-interference capability in closed-loop control, you need to use a shielding wire in the encoder cable and ground the two ends of the shielding wire, that is, connect the shielding layer to the housing of the motor on the motor side, and connect the shielding layer to the PE terminal on the PG card side.

Figure A-1 shows the installation diagram and a VFD with expansion cards installed.
Figure A-1 VFD of 7R5G/011P or higher with expansion cards installed

Expansion card installation process:
Figure A-2 Expansion card installation process diagram

## A. 3 Wiring

1. Ground a shielded cable as follows:

## A. 4 I/O expansion card function description

## A.4.1 IO expansion card 1 (EC-IO501-00)

CME and COM are shorted through J3 before delivery, and J5 is the jumper for selecting the output type (voltage or current) of AO2.

The terminals are arranged as follows:

| Al3 | AO2 | GND |
| :--- | :--- | :--- |

| COM | CME | Y2 | S5 |  |
| :---: | :---: | :---: | :---: | :---: |
| PW | $+24 V$ | S 6 | S 7 | S 8 |

Indicator definition

| Indicator | Name | Function |
| :---: | :---: | :--- |
| LED1 | State indicator | This indicator is on when the expansion card is establishing <br> a connection with the control board; it blinks periodically <br> after the expansion card is properly connected to the <br> control board (the period is 1s, on for 0.5s, and off for the <br> other 0.5s); and it is off when the expansion card is <br> disconnected from the control board. |
| LED4 | Power indicator | This indicator is on after the IO expansion card is powered <br> on by the control board. |

The EC-IO501-00 expansion card can be used in scenarios where the I/O interfaces of a Goodrive350 IP55 high-ingress protection series VFD cannot meet the application requirements. It can provide 4 digital inputs, 1 digital output, 1 analog input, 1 analog output, and two relay outputs. It is user-friendly, providing relay outputs through European-type screw terminals and other inputs and outputs through spring terminals.
EC-IO501-00 terminal function description

| Category | Symbol | Name | Description |
| :---: | :---: | :---: | :---: |
| Power | PW | External power supply | The working power of digital input is provided by an external power supply. <br> Voltage range: 12-30 V <br> The terminals PW and +24 V are shorted before delivery. |
| Analog input/output | AI3-GND | Analog input 1 | 1. Input range: $0-10 \mathrm{~V}, 0-20 \mathrm{~mA}$ <br> 2. Input impedance: $20 \mathrm{k} \Omega$ for voltage input; $250 \Omega$ for current input <br> 3. Set it to be voltage or current input through the corresponding function code. <br> 4. Resolution: When 10 V corresponds to 50 Hz , the minimum resolution is 5 mV . <br> 5. Deviation: $\pm 0.5 \%$; input of 5 V or 10 mA or higher at the temperature of $25^{\circ} \mathrm{C}$ |
|  | AO2-GND | Analog output 1 | 1. Output range: $0-10 \mathrm{~V}, 0-20 \mathrm{~mA}$ <br> 2. Whether it is voltage or current output is determined by J5. <br> 3. Deviation $\pm 0.5 \%$; input of 5 V or 10 mA or higher at the temperature of $25^{\circ} \mathrm{C}$ |

| Category | Symbol | Name | Description |
| :---: | :---: | :---: | :--- |

|  | S8-COM | Digital input 4 | 4. Max. input frequency: 1 kHz |

## A.4.2 IO expansion card 2 (EC-IO502-00)

The terminals are arranged as follows.
$\square$

| S 5 | S 6 | S 7 | S 8 |
| :---: | :---: | :---: | :---: |
| +24 V | PW | COM | COM |

Indicator definition

| Indicator | Name | Function |
| :---: | :---: | :--- |
| LED1 | State indicator | This indicator is on when the expansion card is <br> establishing a connection with the control board; it blinks <br> periodically after the expansion card is properly <br> connected to the control board (the period is 1s, on for <br> 0.5s, and off for the other 0.5s); and it is off when the <br> expansion card is disconnected from the control board. |
| LED4 | Power indicator | This indicator is on after the IO expansion card is <br> powered on by the control board. |

The EC-IO502-00 expansion card can be used in scenarios where the I/O interfaces of the VFD cannot meet the application requirements. It can provide 4 digital inputs, 1 PT100 temperature measurement input (PT1+), 1 PT1000 temperature measurement input (PT2+), and 2 relay outputs. It is user-friendly, providing relay outputs and digital inputs through European-type screw terminals and temperature measurement inputs through spring terminals.

EC-IO502-00 terminal function description

| Category | Symbol | Name | Function |
| :---: | :---: | :---: | :---: |
| Power | PW | External power supply | The working power of digital input is provided by an external power supply. Voltage range: $24(-20 \%)-48 \mathrm{VDC}(+10 \%)$, $24(-10 \%)-48 \mathrm{VAC}(+10 \%)$ |
|  | +24V | Internal power | User power provided by the VFD. Max. output current: 200 mA |
|  | COM | Power reference | Common terminal of +24 V |
| Digital input | S5-COM | Digital input 5 | Internal impedance: $6.6 \mathrm{k} \Omega$ |
|  | S6-COM | Digital input 6 | Supported external power: 24(-20\%)- |
|  | S7-COM | Digital input 7 | $48 \mathrm{VDC}(+10 \%), 24(-10 \%)-48 \mathrm{VAC}(+10 \%)$ |
|  | S8-COM | Digital input 8 | Supporting internal power 24 V <br> Bi-directional input terminals, supporting <br> NPN/PNP modes <br> Max. input frequency: 1 kHz <br> All are programmable digital input terminals. <br> You can set the terminal function via <br> function codes. |
| Temperature detection input | PT1+ | PT100 input | Independent PT100 and PT1000 inputs. |
|  | PT2+ | PT1000 input | PT1+ connects to PT100, and PT2+ connects to PT1000. <br> 1. Resolution: $1^{\circ} \mathrm{C}$ <br> 2. Range: $-20^{\circ} \mathrm{C}-150^{\circ} \mathrm{C}$ <br> 3. Detection accuracy: $3^{\circ} \mathrm{C}$ <br> 4. Supporting offline protection |
|  | PT- | Reference input of PT100/PT1000 | Zero potential reference of PT100/PT1000 |
| Relay output | RO3A | Contact A of NO relay 3 | RO3 relay output. RO3A: NO; RO3C: common terminal <br> Contact capacity: 3A/AC250V, 1A/DC30V |
|  | RO3C | Contact C of NO relay 3 |  |
|  | RO4A | Contact A of NO relay 4 | RO4 relay output. RO4A: NO; RO4C: common terminal <br> Contact capacity: 3A/AC250V, 1A/DC30V |
|  | RO4C | Contact C of NO relay 4 |  |

Figure A-5 Control circuit wiring of IO expansion card 2

## A. 5 Programmable expansion card (EC-PC502-00) function description

SW1 is the start/stop switch of the programmable expansion card. CN1 contains terminals PE, 485-, 485+, GND, AI1, and AO1, and a selection jumper resides on the next. "AI" and "AV" are the current type input selection and voltage type input selection of Al1, and they can be selected through J2. "AIO" and "AVO" are the current type output selection and voltage type output selection of AO1, and they can be selected through J5. "120" indicates $120 \Omega$ terminal resistor, and it can connect to J 1 . By default, J 1 connects to NC , J 2 to AV, and J5 to AVO.
The terminals are arranged as follows:

| PE | $485-$ | $485+$ | GND | Al1 | AO1 |
| :---: | :---: | :---: | :---: | :---: | :---: |

| COM | COM | PS1 | PS2 | PS3 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| PW | $24 V$ | PS4 | PS5 | PS6 | PRO1A |  | PRO1C |

Indicator definition:

| Indicator | Name | Function |
| :---: | :---: | :--- |
| LED1 | Power indicator <br> (Green) | This indicator is on when the expansion card is <br> powered on. |
| LED3 | Communication <br> indicator (Green) | lhis indicator is on when the expansion card is <br> establishing a connection with the control board; it <br> blinks periodically after the expansion card is properly <br> connected to the control board (the period is 1s, on for <br> 0.5s, and off for the other 0.5s); and it is off when the <br> expansion card is disconnected from the control board. |
| LED4 | Error indicator (Red) | This indicator blinks when an error occurs (the blinking <br> period is 1s, on for 0.5s, and off for the other 0.5s). You <br> can query the error types on the upper computer Auto <br> Station. <br> This indicator is off when there is no error. |
| LED5 | Power indicator | lhis indicator is on when the expansion card is <br> powered on. |
| LED6 | RUN indicator (Green) | This indicator is on when the PLC program is running; it <br> is off when the PLC program stops. |

The EC-PC502-00 programmable expansion card can replace some micro PLC applications. It adopts the global mainstream development environment PLC, supporting the instruction language (IL), ladder diagram (LD), and sequential function chart (SFC). It provides a user program storage space of 16 K steps and data storage space of 8 K words, and supports saving data of 1 K words at power failure, which facilitate customers' secondary development and meets the customization requirements.

The EC-PC502-00 programmable expansion card provides 6 digital inputs, 2 relay outputs, 1 analog input, 1 analog output, 1 RS485 communication channel (supports master/slave switchover). It is user-friendly, providing relay outputs through European-type screw terminals and other inputs and outputs through spring terminals.
EC-PC502-00 terminal function description:

| Category | Symbol | Name | Function |
| :---: | :---: | :---: | :---: |
| Power supply | PW | External power supply | To provide input digital working power from external to internal. <br> Voltage range: 12-24V <br> PW and +24 V should be short connected. |
|  | 24 V | Internal power supply | Internal output power supply, 100mA |
| Common terminal/ground | COM | Common terminal of +24 V | Common terminal of +24 V . If PS1 is connected, COM indicates PS1 is connected. |
|  | GND | Analog ground | Reference zero potential of +10 V |
|  | PE | Protective earthing terminal | Protective earthing terminal |

| Category | Symbol | Name | Function |
| :---: | :---: | :---: | :---: |
| Digital input | PS1-COM | Digital input 1 | 1. Internal impedance: $4 \mathrm{k} \Omega$ <br> 2. Accept $12-30 \mathrm{~V}$ voltage input <br> 3. Bi-directional input terminal <br> 4. Max. input frequency: 1 kHz <br> 5. Both source and sink inputs are allowed, but the input types must be the same |
|  | PS2-COM | Digital input 2 |  |
|  | PS3-COM | Digital input 3 |  |
|  | PS4-COM | Digital input 4 |  |
|  | PS5-COM | Digital input 5 |  |
|  | PS6-COM | Digital input 6 |  |
| Analog input and output | Al1 | Analog input 1 | 1. Input range: Al1 voltage and current range: 0-10V, $0-20 \mathrm{~mA}$ <br> 2. Input impedance: $20 \mathrm{k} \Omega$ during voltage input; $250 \Omega$ during current input <br> 3. Voltage or current input is set through the jumper. <br> 4. Resolution ratio: When 10 V corresponds to 50 Hz , the min. resolution ratio is 5 mV <br> 5. Deviation: $\pm 1 \%$ when the input reaches full the measurement range at $25^{\circ} \mathrm{C}$ |
|  | AO1 | Analog output 1 | 1. Output range: $0-10 \mathrm{~V}$ voltage or $0-20 \mathrm{~mA}$ current <br> 2. Voltage or current output is set through the jumper. <br> 3. Deviation: $\pm 1 \%$ when the input reaches full the measurement range at $25^{\circ} \mathrm{C}$. |
| Relay output | PRO1A | NO contact of relay 1 | 1. Contact capacity: $2 \mathrm{~A} / \mathrm{AC} 250 \mathrm{~V}, 1 \mathrm{~A} / \mathrm{DC} 30 \mathrm{~V}$ <br> 2. Unable to function as high frequency switch output |
|  | PRO1C | Common contact of relay 1 |  |
|  | PRO2A | NO contact of relay 2 |  |
|  | PRO2C | Common contact of relay 2 |  |
| Communication | 485+ | RS485 communication terminal | RS485 communication port, which can be set as the master or slave through the Auto Station. It is differential signal output. Whether to connect the $120 \Omega$ resistor of RS485 is set through the jumper. |
|  | 485- |  |  |

For details about the operation of programmable expansion cards, see the Goodrive350 series AutoStation programmable card manual.

## A. 6 Communication card

## A.6.1 Bluetooth communication card (EC-TX501) and WIFI communication card (EC-TX502)

Definitions of indicators and function buttons:

| Indicator | Name | Function |
| :---: | :---: | :--- |
| LED1/LED3 | Bluetooth/WIFI state <br> indicator | On: The expansion card is establishing a connection <br> with the control board. <br> Blinking periodically: The expansion card is properly <br> connected to the control board (the period is 1s, on <br> for 0.5s, and off for the other 0.5s). <br> Off: The expansion card is disconnected from the <br> control board. |
| LED2 | Bluetooth <br> communication state <br> indicator | On: Bluetooth communication is online and data <br> exchange can be performed. <br> Off: Bluetooth communication is not in the online <br> state. |
| LED5 | Power indicator | On: The control board feeds power to the Bluetooth <br> card. |
| SW1 | WIFI factory reset <br> button | It is used to restore the expansion card to default <br> values and return to the local monitoring mode. |
| SW2 | WIFI hardware reset <br> button | It is used to restart the expansion card. |

The wireless communication card is especially useful for scenarios where you cannot directly use the keypad to operate the VFD due to the restriction of the installation space. With a mobile phone APP, you can operate the VFD in a maximum distance of 30 m . You can choose a PCB antenna or an external sucker antenna. If the VFD is located in an open space and is a molded case machine, you can use a built-in PCB antenna; and if it is a sheetmetal machine and located in a metal cabinet, you need to use an external sucker antenna.
When installing a sucker antenna, install a wireless communication card on the VFD first, and then lead the SMA connector of the sucker antenna into the VFD and screw it to CN2, as shown in the following figure. Place the antenna base on the chassis and expose the upper part. Try to keep it unblocked.

The wireless communication card must be used with the INVT VFD APP. Scan the QR code of the VFD nameplate to download it. For details, refer to the wireless communication card manual provided with the expansion card. The main interface is shown as follows.

## A.6.2 PROFIBUS-DP communication card (EC-TX503)

CN1 is a 9-pin D-type connector, as shown in the following figure.

| Connector pin |  | Description |
| :---: | :---: | :---: |
| 1 | - | Unused |
| 2 | - | Unused |
| 3 | B-Line | Data+ (twisted pair 1) |
| 4 | RTS | Request sending |
| 5 | GND_BUS | Isolation ground |
| 6 | +5 V BUS | Isolated power supply of 5 V DC |
| 7 | - | Unused |
| 8 | A-Line | Data- (twisted pair 2) |
| 9 | - | Unused |
| Housing | SHLD | PROFIBUS cable shielding line |

+5 V and GND_BUS are bus terminators. Some devices, such as the optical transceiver (RS485), may need to obtain power through these pins.
On some devices, the transmission and receiving directions are determined by RTS. In normal applications, only A-Line, B-Line, and the shield layer need to be used.

| Indicator | Name | Function |
| :---: | :---: | :--- |
| LED1 | State indicator | On: The expansion card is establishing a connection with <br> the control board. <br> Blinking periodically: The expansion card is properly <br> connected to the control board (the period is 1s, on for <br> 0.5s, and off for the other 0.5s). <br> Off: The expansion card is disconnected from the control <br> board. |
| LED2 | Online indicator | On: The communication card is online and data <br> exchange can be performed. <br> Off: The communication card is not in the online state. |

| Indicator | Name | Function |
| :---: | :---: | :--- |
|  |  | On: The communication card is offline and data <br> exchange cannot be performed. <br> Blinks: The communication card is not in the offline state. <br> Blinks at the frequency of 1 Hz: A configuration error <br> occurs: The length of the user parameter data set during <br> the initialization of the communication card is different <br> from that during the network configuration. <br> LED3 <br> Blinks at the frequency of 2 Hz: User parameter data is <br> incorrect. The length or content of the user parameter <br> data set during the initialization of the communication <br> card is different from that during the network <br> configuration. <br> Blinks at the frequency of 4 Hz: An error occurs in the <br> ASIC initialization of PROFIBUS communication. indicat <br> Off: The diagnosis function is disabled. |
| LED4 | Power indicator | On: The control board feeds power to the communication <br> card. |

For details about the operation, see the Communication Card Operation Manual.

## A.6.3 Ethernet communication card (EC-TX504)

The EC-TX504 communication card adopts standard RJ45 terminals. The EC-TX504 card supports INVT Workshop software. For usage with standard Ethernet/IP protocol, please install the EC-TX510 card.

Indicator definition

| Indicator | Name | Function |
| :---: | :---: | :--- |
| LED1 | State indicator | On: The expansion card is establishing a connection with <br> the control board. <br> Blinking periodically: The expansion card is properly <br> connected to the control board (the period is 1s, on for 0.5s, <br> and off for the other 0.5s). <br> Off: The expansion card is disconnected from the control board. |
| LED2 | Network connection <br> status indicator | On: The physical connection to the upper computer is <br> normal. <br> Off: The upper computer is disconnected. |
| LED3 | Network | On: There is data exchange with the upper computer. |

| Indicator | Name | Function |
| :---: | :---: | :--- |
|  | communication <br> status indicator | Off: There is no data exchange with the upper computer. |
| LED4 | Power indicator | On: The control board feeds power to the communication <br> card. |

## A.6.4 CAN multi-protocol communication card (EC-TX505C)

The EC-TX505C communication card is user-friendly, adopting European-type screw terminals.

| Label | Description |  |
| :---: | :---: | :--- |
| PGND | Isolation ground | Isolation ground |
| PE | Shielded | CAN bus shielding |
| CANH | CANopen bus high level signal | CAN bus high level signal |
| CANL | CANopen bus low level signal | CAN bus low level signal |
| 485 | 485 terminal resistor switch | ON: RS485+ and RS485- are connected to a <br> terminal resistor of $120 \Omega$. |
|  | OFF: RS485+ and RS485- are not connected <br> to a terminal resistor. |  |
| CAN | CAN terminal resistor switch | ON: CAN_H and CAN_L are connected to a <br> terminal resistor of $120 \Omega$. |
| OFF: CAN_H and CAN_L are not connected to <br> a terminal resistor. |  |  |

Note: Before power on, please select the protocol type by setting the DIP switch SW2 as follows:

| DIP switch SW2 |  |  |  |
| :---: | :---: | :--- | :--- |
| 1 | 2 | Protocol type |  |
| OFF | OFF | CANopen |  |
| ON | OFF | CAN master/slave |  |

Indicator definition

| Indicator | Name | Function |
| :---: | :---: | :--- |
| LED1 | State indicator | On: The expansion card is establishing a connection with <br> the control board. <br> Blinking periodically: The expansion card is properly |

| Indicator | Name | Function |
| :---: | :--- | :--- |
|  |  | connected to the control board (the period is 1s, on for 0.5s, <br> and off for the other 0.5s). <br> Off: The expansion card is disconnected from the control <br> board. |
| LED2 | Running indicator | On: The communication card is running. <br> Blinks: The communication card is in the pre-operation <br> state. <br> Off: A fault occurs. Check whether the reset pin of the <br> communication card and the power supply are properly <br> connected. The communication card is in the stopped state. |
| LED3 | Error indicator | On: The CAN controller bus is off, a fault occurs on the <br> inverter, or a received frame is missed or an error occurs <br> during frame receiving. <br> Off: The communication card is in the working state. |
| LED4 | Power indicator | On: The control board feeds power to the communication <br> card. |

For details about the operation, see the Communication Card Operation Manual.

## A.6.5 PROFINET communication card (EC-TX509)

The terminal CN2 adopts a standard RJ45 interface, where CN2 is the dual RJ45 interface, and these two RJ45 interfaces are not distinguished from each other and can be interchangeably inserted. They are arranged as follows:

| Pin | Name | Description |
| :---: | :---: | :---: |
| 1 | $\mathrm{n} / \mathrm{c}$ | Not connected |
| 2 | $\mathrm{n} / \mathrm{c}$ | Not connected |
| 3 | $\mathrm{RX}-$ | Receive Data- |
| 4 | $\mathrm{n} / \mathrm{c}$ | Not connected |
| 5 | $\mathrm{n} / \mathrm{c}$ | Not connected |
| 6 | $\mathrm{RX}+$ | Receive Data+ |
| 7 | $\mathrm{TX}-$ | Transmit Data- |
| 8 | $\mathrm{TX}+$ | Transmit Data+ |

Definition of the state indicator
The PROFINET communication card has 9 indicators, of which LED1 is the power indicator,

LED2-5 are the communication state indicator of the communication card, and LED6-9 are the state indicators of the network port.

| LED | Color | State | Description |
| :---: | :---: | :---: | :---: |
| LED1 | Green |  | 3.3V power indicator |
| LED2 <br> (Bus state indicator) | Red | On | No network connection |
|  |  | Blinking | The connection to the network cable between the PROFINET controller is OK, but the communication is not established. |
|  |  | Off | Communication with the PROFINET controller has been established |
| LED3 <br> (System fault indicator) | Green | On | PROFINET diagnosis exists |
|  |  | Off | No PROFINET diagnosis |
| LED4 <br> (Slave ready indicator) | Green | On | TPS-1 protocol stack has started |
|  |  | Blinking | TPS-1 waits for MCU initialization |
|  |  | Off | TPS-1 protocol stack does not start |
| LED5 <br> (Maintenance state indicator) | Green | 1 | Manufacturer-specific-depending on the characteristics of the device |
| LED6/7 <br> (Network port state indicator) | Green | On | PROFINET communication card and PC/PLC have been connected via a network cable |
|  |  | Off | PROFINET communication card and PC/PLC have not been connected yet |
| LED8/9 <br> (Network port communication indicator) | Green | Blinking | PROFINET communication card and PC/PLC are communicating |
|  |  | Off | PROFINET communication card and PC/PLC are not yet communicating |

## Electrical connection

The PROFINET communication card adopts a standard RJ45 interface and can adopt the linear network topology or star network topology. The electrical connection in linear network topology mode is shown in the following.

The star network topology electrical connection diagram is shown in the following:

Note: For the star network topology, users need to prepare PROFINET switches.

## A.6.6 Ethernet/IP communication card (EC-TX510) and Modbus TCP communication card (EC-TX515)

The terminal CN2 adopts standard dual RJ45 interfaces, and the two RJ45 interfaces are not distinguished from each other and can be interchangeably inserted.

Figure A-6 Standard RJ45 interface

## Standard RJ45 interface functions

| Pin | Name | Description |
| :---: | :---: | :---: |
| 1 | $\mathrm{TX}+$ | Transmit Data+ |
| 2 | $\mathrm{TX}-$ | Transmit Data- |
| 3 | $\mathrm{RX}+$ | Receive Data + |
| 4 | $\mathrm{n} / \mathrm{c}$ | Not connected |
| 5 | $\mathrm{n} / \mathrm{c}$ | Not connected |
| 6 | $\mathrm{RX}-$ | Receive Data- |
| 7 | $\mathrm{n} / \mathrm{c}$ | Not connected |
| 8 | $\mathrm{n} / \mathrm{c}$ | Not connected |

## State indicators

The EtherNet/IP communication card provides four LED indicators and four net port indicators to indicate its states.

| LED | Color | State | Description |
| :---: | :---: | :---: | :--- |
| LED1 | Green | On | The card is shaking hands with the VFD. |
|  |  | Blinking (1Hz) | The card and VFD communicate normally. |
|  | Off | The card and VFD communicate improperly. |  |
| Green | On | The communication between the card and PLC is <br> online and data interchange is allowed. |  |
|  |  | Blinking (1Hz) | IP address conflict between the card and PLC. |
|  | Off | The communication between the card and PLC is |  |

| LED | Color | State | Description |
| :---: | :---: | :---: | :---: |
|  |  |  | offline. |
| LED3 | Red | On | Failed to set up I/O between the card and PLC. |
|  |  | Blinking (1Hz) | Incorrect PLC configuration. |
|  |  | Blinking (2Hz) | The card failed to send data to the PLC. |
|  |  | Blinking (4Hz) | The connection between the card and PLC timed out. |
|  |  | Off | No fault. |
| LED4 | Red | On | 3.3V power indicator. |
| Net port indicator | Yellow | On | Link indicator, indicating successful Ethernet connection. |
|  |  | Off | Link indicator, indicating Ethernet connection not established. |
| Net port indicator | Green | On | ACK indicator, indicating data interchange being performed. |
|  |  | Off | ACK indicator, indicating data interchange not be performed. |

## Electrical wiring

The EtherNet/IP communication card provides standard RJ45 ports and supports the linear, star, and ring topologies. The following three figures show the electrical wiring diagrams.

Use CAT5, CAT5e, and CAT6 network cables for electrical wiring. When the communication distance is greater than 50 meters, use high-quality network cables that meet the high-quality standards.

Figure A-7 Electrical wiring diagram for a linear topology

Figure A-8 Electrical wiring diagram for a star topology

Note: Ethernet switches must be available when the star topology is used.

Figure A-9 Electrical wiring diagram for a ring network

## A. 7 PG expansion card function description

## A.7.1 Sin/Cos PG card (EC-PG502)

The terminals are arranged as follows:

|  |  |  |  |  |  |  | $\mathrm{C} 1+$ | $\mathrm{C} 1-$ | $\mathrm{D} 1+$ | $\mathrm{D} 1-$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| PE | $\mathrm{AO}+$ | $\mathrm{BO}+$ | $\mathrm{ZO}+$ | $\mathrm{A} 1+$ | $\mathrm{B} 1+$ | $\mathrm{R} 1+$ | $\mathrm{A} 2+$ | $\mathrm{B} 2+$ | $\mathrm{Z} 2+$ | PWR |
| GND | $\mathrm{AO}-$ | $\mathrm{BO}-$ | $\mathrm{ZO}-$ | $\mathrm{A} 1-$ | $\mathrm{B} 1-$ | $\mathrm{R} 1-$ | $\mathrm{A} 2-$ | $\mathrm{B} 2-$ | $\mathrm{Z} 2-$ | GND |

Indicator definition

| Indicator | Name | Description |
| :---: | :---: | :--- |
| LED1 | Disconnection <br> indicator | Off: A1 and B1 of the encoder are disconnected. <br> Blinking: C1 and D1 of the encoder are disconnected. <br> On: The encoder signals are normal. |
| LED2 | Power indicator | On: The control board feeds power to the PG card. <br> LED3 State indicator | | On: The expansion card is establishing a connection with the |
| :--- |
| control board. |
| Blinking periodically: The expansion card is properly connected |
| to the control board (the period is 1 s , on for 0.5 s , and off for the |
| other 0.5s). |
| Off: The expansion card is disconnected from the control board. |

EC-PG502 terminal function description

| Signal | Port | Function |

| ZO- |  |  |

The following figure shows the external wiring of the PG card when it is used in combination with an encoder without CD signals.

The following figure shows the external wiring of the PG card when it is used in combination with an encoder with CD signals.

## A.7.2 UVW incremental PG card (EC-PG503-05)

The terminals are arranged as follows:

|  |  |  |  |  | A2+ | A2- | B2+ | B2- | Z2+ | Z2- |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| PE | AO+ | BO+ | ZO+ | A1+ | B1+ | Z1+ | U+ | V+ | W+ | PWR |
| GND | AO- | BO- | ZO- | A1- | B1- | Z1- | U- | V- | W- | PGND |

Indicator definition

| Indicator | Name | Function |
| :---: | :---: | :--- |
| LED1 | Disconnection <br> indicator | This indicator blinks only if A1 or B1 signal is disconnected <br> during encoder rotating; and it is on in other cases. |
| LED2 | State indicator | On: The expansion card is establishing a connection with <br> the control board. |

| Indicator | Name | Function |
| :---: | :---: | :--- |
|  |  | Blinking periodically: The expansion card is properly <br> connected to the control board (the period is 1s, on for 0.5s, <br> and off for the other 0.5s). <br> Off: The expansion card is disconnected from the control <br> board. |
| LED3 | Power indicator | On: The control board feeds power to the PG card. |

The EC-PG503-05 expansion card supports the input of absolute position signals and integrates the advantages of absolute and incremental encoders. It is user-friendly, adopting spring terminals.

## EC-PG503-05 terminal function description

| Signal | Port | Description |
| :---: | :---: | :---: |
| PWR | Encoder power | Voltage: $5 \mathrm{~V} \pm 5 \%$ <br> Max. current: 200 mA |
| PGND |  |  |

The following figure shows the external wiring of the EC-PG504-00 expansion card.

## A.7.4 Multi-function incremental PG card (EC-PG505-12)

The dual in-line package (DIP) switch SW1 is used to set the voltage class ( 5 V or 12 V ) of the power supply of the encoder. The DIP switch can be operated with an auxiliary tool.
The terminals are arranged as follows:

| PE | AO + | $\mathrm{BO}+$ | $\mathrm{ZO}+$ | $\mathrm{A} 1+$ | $\mathrm{B} 1+$ | $\mathrm{Z} 1+$ | $\mathrm{A} 2+$ | $\mathrm{B} 2+$ | $\mathrm{Z} 2+$ | PWR |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| GND | $\mathrm{AO}-$ | $\mathrm{BO}-$ | $\mathrm{ZO}-$ | $\mathrm{A} 1-$ | $\mathrm{B} 1-$ | $\mathrm{Z} 1-$ | $\mathrm{A} 2-$ | $\mathrm{B} 2-$ | $\mathrm{Z} 2-$ | PGND |

Indicator definition

| Indicator | Name | Function |
| :---: | :---: | :--- |
| LED1 | State indicator | This indicator is on when the expansion card is establishing a <br> connection with the control board; it blinks periodically after <br> the expansion card is properly connected to the control board <br> (the period is 1s, on for 0.5s, and off for the other 0.5s); and it <br> is off when the expansion card is disconnected from the <br> control board. |
| LED2 | Disconnection <br> indicator | When the encoder is rotating, this indicator blinks when A1 or <br> B1 of the encoder are disconnected; otherwise it is always on. |
| LED3 | Power indicator | This indicator is on after the control board feeds power to the <br> PG card. |

The EC-PG505-12 expansion card can be used in combination with multiple types of incremental encoders through different modes of wiring. It is user-friendly, adopting spring terminals.

EC-PG505-12 terminal function description

| Label | Name | Function description |

| B2+ |  |  |
| B2- |  |  |
| Z2+ |  |  |
| Z2- |  |  |
| AO+ | Frequency-divided output | 1. Supporting open collector output. The input is externally connected with the upper resistor. <br> 2. Supporting frequency division of $1-255$, which can be set through P20.16 or P24.16. <br> 3. Supporting frequency division output source, which can be set through P20.17 or P24.17. |
| BO+ |  |  |
| ZO+ |  |  |

The following figure shows the external wiring of the PG card when it is used in combination with an open collector encoder. A pull-up resistor is configured in the PG card.

The following figure shows the external wiring of the PG card when it is used in combination with a push-pull encoder.

## A.7.6 Simplified incremental PG card (EC-PG507-12)

The terminals are arranged as follows:
The DIP switch SW1 is used to set the voltage class ( 5 V or 12 V ) of the power supply of the encoder. The DIP switch can be operated with an auxiliary tool.

| PE | $\mathrm{A} 1+$ | $\mathrm{B} 1+$ | $\mathrm{Z} 1+$ | PWR |
| :---: | :---: | :---: | :---: | :---: |
| PGND | $\mathrm{A} 1-$ | $\mathrm{B} 1-$ | $\mathrm{Z} 1-$ | PGND |

Indicator definition

| Indicator | Name | Description |
| :---: | :---: | :--- |
| LED1 | State indicator | On: The expansion card is establishing a connection with the <br> control board. <br> Blinking periodically: The expansion card is properly connected <br> to the control board (the period is 1s, on for 0.5s, and off for the <br> other 0.5s). <br> Off: The expansion card is disconnected from the control board. |
| LED2 | Disconnection <br> indicator | Off: A1 or B1 of the encoder is disconnected. <br> On: The encoder pulses are normal. |
| LED3 | Power indicator | On: The control board feeds power to the PG card. |

The EC-PG507-12 expansion card can be used in combination with multiple types of incremental encoders through different modes of wiring. The wiring modes of the encoder interfaces are the same as that of the PG card EC-PG505-12.
EC-PG507-12 terminal function description

| Signal | Port | Description |
| :---: | :---: | :---: |
| PWR |  | Voltage: 5V/12V $\pm 5 \%$ |
| PGND | Encoder power | Max. current: 150 mA <br> The voltage class can be selected through SW1, depending on the encoder voltage class. |
| A1+ | Encoder interface | 1. Supporting push-pull interfaces of $5 \mathrm{~V} / 12 \mathrm{~V}$ <br> 2. Supporting open collector interfaces of $5 \mathrm{~V} / 12 \mathrm{~V}$ <br> 3. Supporting differential interfaces of 5 V <br> 4. Response frequency: 400 kHz <br> 5. Supporting the encoder cable length of up to 50 m |
| A1- |  |  |
| B1+ |  |  |
| B1- |  |  |
| Z1+ |  |  |
| Z1- |  |  |

## A.7.7 24V simplified incremental PG card (EC-PG507-24)

The terminals are arranged as follows:

| PE | A1 + | B1 + | Z1 + | PWR |
| :---: | :---: | :---: | :---: | :---: |
| PGND | A1- | B1- | Z1- | PGND |

## Indicator definition

| Indicator | Name | Description |
| :---: | :---: | :--- |
| LED1 | State indicator | This indicator is on when the expansion card is <br> establishing a connection with the control board; it blinks <br> periodically after the expansion card is properly connected <br> to the control board (the period is 1s, on for 0.5s, and off <br> for the other 0.5s); and it is off when the expansion card is <br> disconnected from the control board. |
| LED2 | Disconnection <br> indicator | Off: A1 or B1 of the encoder is disconnected. <br> On: The encoder pulses are normal. |
| LED3 | Power indicator | This indicator is on after the control board feeds power to <br> the PG card. |

EC-PG507-24 can work in combination with multiple types of incremental encoders through various external wiring modes. It is easy to use for the use of 5.08 mm pitch terminal.
EC-PG507-24 terminal function description

| Signal | Port | Description |
| :---: | :---: | :---: |
| PE | Grounding terminal | Connected to the ground to enhance anti-interference performance. |
| PWR | Encoder power | Voltage: $24 \mathrm{~V} \pm 5 \%$; Max. output current: 150 mA (PGND is the ground for power isolation) |
| PGND |  |  |
| A1+ | Encoder interface | 1. Supporting push-pull interfaces of 24 V <br> 2. Supporting open collector interfaces of 24 V <br> 3. Supporting differential interfaces of 24 V <br> 4. Frequency response: 200 kHz <br> 5. Supporting upporting the encoder cable length of up to 100 m |
| A1- |  |  |
| B1+ |  |  |
| B1- |  |  |
| Z1+ |  |  |
| Z1- |  |  |

The following figure shows the external wiring of the PG card when it is used in combination with an open collector encoder. A pull-up resistor is configured in the PG card.

The following figure shows the external wiring of the PG card when it is used in combination with a push-pull encoder.

The following figure shows the external wiring of the PG card when it is used in combination with a differential encoder.

## A. 8 IoT cards

## A.8.1 GPRS card (EC-IC501-2)

CN6 pin definition

| Pin | Name | Description |
| :---: | :---: | :---: |
| 1 | $485-$ | 485 B |
| 2 | $485+$ | 485 A |
| 3 | GND | Power ground |
| 4 | 24 V | 24 V power |

State indicator definition
The GPRS IoT card has five state indicators.

| Indicator | Name | Function |
| :---: | :---: | :--- |
| LED1 | Handshaking indicator | It blinks at a frequency of 1s when the card <br> normally connects to the control board. |
| LED2 | Power indicator | It is on upon power on. |
| LED3 | Run indicator | The card communicates normally. |
| LED4 | GPRS state indicator | When GPRS connects to the network, it blinks fast <br> at a specific interval (with 64ms on and 300ms off); <br> when GPRS does not connect to the network, it <br> blinks slowly at a specific interval (with 64ms on <br> and 800ms off). |
| LED5 | State indicator | It is always on when the GPRS module is powered <br> on. |

For details, see the EC series GPRS expansion card manual.

## A.8.2 4G card (EC-IC502-2-CN, EC-IC502-2-EU, EC-IC502-2-LA)

Terminal definition

| Terminal | Description |
| :---: | :---: |
| 24 V | Power supply + |
| GND | Power supply - |
| $485+$ | 485 A |
| $485-$ | 485 B |
| 4 G | 4 G antenna |
| CN3 | SIM card tray |

Indicator definition

| Indicator | $\quad$ Description |
| :---: | :--- |
| NET | Network indicator <br> Blinking slowly (On: 600ms; Off: 600ms): No SIM card/Network registration in <br> progress/Registration failed. <br> Blinking fast (On: 75ms; Off: 75ms): Data link established. |
| RUN | Running indicator <br> Blinking (On: 1s; Off: 1s): The system runs properly. <br> On or Off: System exceptions happened. |
| SPI | Handshaking indicator <br> Blinking (On: 1s; Off: 1s): Handshaking between the expansion card and VFD <br> control board is successful. |
| On: Handshaking failed or no handshaking. |  |

Note: For details about the operation, see the EC Series 4G Expansion Card Operation Manual.

## Appendix B Technical data

## B. 1 What this chapter contains

This chapter describes the technical data of the VFD and its compliance to CE and other quality certification systems.

## B. 2 Derated application

## B.2.1 Capacity

Choose a VFD based on the rated current and power of the motor. To endure the rated power of the motor, the rated output current of the VFD must be larger or equal to the rated current of the motor. The rated power of the VFD must be higher or equal to that of the motor.

## Note:

1. The maximum allowable shaft power of the motor is limited to 1.5 times the rated power of the motor. If the limit is exceeded, the VFD automatically restricts the torque and current of the motor. This function effectively protects the input shaft against overload.
2. The rated capacity is the capacity at the ambient temperature of $40^{\circ} \mathrm{C}$.
3. You need to check and ensure that the power flowing through the common DC connection in the common DC system does not exceed the rated power of the motor.

## B.2.2 Derating

If the ambient temperature on the site where the VFD is installed exceeds $40^{\circ} \mathrm{C}$, the altitude exceeds 1000 m , the heat emission hole coverplate is used, or the carrier frequency is greater than the recommended frequency in the manual (see function code P00.14 for the recommended frequency), the VFD needs to be derated.

## B.2.2.1 Derating due to temperature

When the temperature ranges from $+40^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$, the rated output current is derated by $1 \%$ for each increased $1^{\circ} \mathrm{C}$. For the actual derating, see the following figure.

Figure B-1 Diagram of actual temperature deraing

Note: It is not recommended to use the VFD at a temperature higher than $50^{\circ} \mathrm{C}$. In case of violation, we shall bear no liability for the consequences caused.

## B.2.2.2 Derating due to altitude

When the installation site altitude is lower than 1000 m , the VFD can run at the rated power. When the installation site altitude exceeds 1000 m , derate $1 \%$ for every increase of 100 m ; when the installation site altitude exceeds 3000 m , consult the local INVT dealer or office.

## B.2.2.3 Derating due to carrier frequency

The power of Goodrive350 IP55 high-ingress protection series VFDs varies according to carrier frequencies. The rated power of a VFD is defined based on the carrier frequency set in factory. If the carrier frequency exceeds the factory setting, the power of the VFD is derated by $10 \%$ for each increased 1 kHz .

## B. 3 Grid specifications

| Grid voltage | AC 3PH $380 \mathrm{~V}(-15 \%)-440 \mathrm{~V}(+10 \%)$ |
| :---: | :--- |
| Short-circuit capacity | According to the definition in IEC 61439-1, the maximum allowable <br> short-circuit current at the incoming end is 100kA. Therefore, the <br> VFD is applicable to scenarios where the transmitted current in the <br> circuit is no larger than 100kA when the VFD runs at the maximum <br> rated voltage. |
| Frequency | $50 / 60 \mathrm{~Hz} \pm 5 \%$, with a maximum change rate of $20 \% / \mathrm{s}$ |

## B. 4 Motor connection data

| Motor type | Asynchronous induction motor or permanent-magnet synchronous <br> motor |
| :---: | :--- |
| Voltage | 0-U1 (rated voltage of the motor), 3PH symmetrical, Umax (rated <br> voltage of the VFD) at the field-weakening point |
| Short-circuit protection | The short-circuit protection for the motor output meets the <br> requirements of IEC 61800-5-1. |
| Frequency | $0-400 \mathrm{~Hz}$ |
| Frequency resolution | 0.01 Hz |
| Current | See section 3.6 Rated values. |
| Power limit | 1.5 times the rated power of the motor |
| Field-weakening point | $10-400 \mathrm{~Hz}$ |
| Carrier frequency | $4,8,12$, or 15 kHz |

## B.4.1 EMC compatibility and motor cable length

The following table describes the maximum motor cable lengths of -AS models that meet the requirements of the EU EMC directive (2014/30/EU).

| All models | Maximum motor cable length (m) |
| :---: | :---: |
| Environment category II (C3) | 30 |

You can learn the maximum length of the motor cable through the running parameters of the VFD. To understand the accurate maximum cable length for using an external EMC filter, contact the local INVT office.

For description about the environments categories II (C3), see section B. 6 "EMC regulations".

## B. 5 Application standards

The following table describes the standards that the VFDs comply with.

| EN/ISO 13849-1 | Safety of machinery—Safety-related parts of control systems—Part 1: <br> General principles for design |
| :---: | :--- |
| IEC/EN 60204-1 | Safety of machinery—Electrical equipment of machines. Part 1: <br> General requirements |
| IEC/EN 62061 | Safety of machinery—Safety-related functional safety of electrical, <br> electronic, and programmable electronic control systems |
| IEC/EN 61800-3 | Adjustable speed electrical power drive systems—Part 3:EMC <br> requirements and specific test methods |
| IEC/EN 61800-5-1 | ldjustable speed electrical power drive systems—Part 5-1: Safety <br> requirements—Electrical, thermal and energy |
| IEC/EN 61800-5-2 | Adjustable speed electrical power drive systems—Part 5-2: Safety <br> requirements—Function |
| GB/T 30844.1 | General-purpose variable-frequency adjustable-speed equipment of 1 <br> kV and lower-Part 1: Technical conditions |
| GB/T 30844.2 | General-purpose variable-frequency adjustable-speed equipment of 1 <br> kV and lower-Part 2: Test methods |
| GB/T 30844.3 | General-purpose variable-frequency adjustable-speed equipment of 1 <br> kV and lower—Part 3: Safety regulations |

## B.5.1 CE marking

The CE marking on the name plate of a VFD indicates that the VFD is CE-compliant, meeting the regulations of the European low-voltage directive (2014/35/EU) and EMC directive (2014/30/EU).

## B.5.2 EMC compliance declaration

European union (EU) stipulates that the electric and electrical devices sold in Europe cannot generate electromagnetic disturbance that exceeds the limits stipulated in related standards, and can work properly in environments with certain electromagnetic interference. The EMC product standard (EN 61800-3) describes the EMC standards and specific test methods for adjustable speed electrical power drive systems. Our products have been compliant with these EMC regulations.

## B. 6 EMC regulations

The EMC product standard (EN 61800-3) describes the EMC requirements on VFDs.
Application environment categories
Category I: Civilian environments, including application scenarios where VFDs are directly connected to the civil power supply low-voltage grids without intermediate transformers

Category II: All environments except those in Category I.
VFD categories
C1: Rated voltage lower than 1000 V , applied to environments of Category I.
C2: Rated voltage lower than 1000 V , non-plug, socket, or mobile devices; power drive systems that must be installed and operated by specialized personnel when applied to
environments of Category I.
Note: The EMC standard IEC/EN 61800-3 no longer restricts the power distribution of VFDs, but it specifies their use, installation, and commissioning. Specialized personnel or organizations must have the necessary skills (including the EMC-related knowledge) for installing and/or performing commissioning on the electrical drive systems.
C3: Rated voltage lower than 1000 V , applied to environments of Category II. They cannot be applied to environments of Category I .
C4: Rated voltage higher than 1000 V , or rated current higher or equal to 400 A , applied to complex systems in environments of Category II.

## B.6.1 VFD category C2

The induction disturbance limit meets the following stipulations:

1. Select an optional EMC filter according to Appendix $D$ and install it following the description in the EMC filter manual.
2. Select the motor and control cables according to the description in the manual.
3. Install the VFD according to the description in the manual.
4. For the maximum length of the motor cable, see section B.4.1 "EMC compatibility and motor cable length".

The VFD may generate radio interference, and therefore you need to take measures to reduce the interference.

## B.6.2 VFD category C3

The anti-interference performance of the VFD meets the requirements of environments Category II in the IEC/EN 61800-3 standard.

The induction disturbance limit meets the following stipulations:

1. Select an optional EMC filter according to Appendix $D$ and install it following the description in the EMC filter manual.
2. Select the motor and control cables according to the description in the manual.
3. Install the VFD according to the description in the manual.
4. For the maximum length of the motor cable, see section B.4.1 "EMC compatibility and motor cable length".

VFDs of C3 category cannot be applied to civilian low-voltage common grids. When applied to such grids, the VFD may generate radio frequency electromagnetic interference.

## Appendix C Dimension drawings

## C. 1 What this chapter contains

This chapter describes the dimension drawings of Goodrive350 IP55 high-ingress protection series VFDs. The dimension unit used in the drawings is mm .

## C. 2 VFD structure

Figure C-1 VFD structure diagram

## C. 3 Dimensions of VFDs

## C.3.1 Wall-mounting dimensions

## Appendix D Optional peripheral accessories

## D. 1 What this chapter contains

This chapter describes how to select optional accessories of Goodrive350 IP55 high-ingress protection series VFDs.

## D. 2 Wiring of peripheral accessories

The following figure shows the external wiring of a Goodrive350 IP55 high-ingress protection series VFD.

## Note:

1. VFDs of $037 \mathrm{G} / 045 \mathrm{P}$ or lower are equipped with built-in brake units, and VFDs of 045G/055P-110G support optional built-in brake units
2. VFDs of 018G/022P to 110 G are equipped with built-in DC reactors.
3. The brake units INVT's DBU series standard brake units. For details, see the DBU operation manual.

| Image | Name | Description |
| :--- | :--- | :--- |
| Accessory for signal transmission |  |  |

## D. 3 Power supply

Refer to the electrical installation.
4 Ensure that the voltage class of the VFD is consistent with that of the grid.

## D. 4 Cables

## D.4.1 Power cables

The sizes of the input power cables and motor cables must meet the local regulation.

- The input power cables and motor cables must be able to carry the corresponding load currents.
- The maximum temperature margin of the motor cables in continuous operation cannot be lower than $70^{\circ} \mathrm{C}$.
- The conductivity of the PE grounding conductor is the same as that of the phase conductor. For models higher than 30 kW , the cross sectional area of the PE grounding conductor can be slightly less than the recommended area.
- For details about the EMC requirements, see Appendix B "Technical data".

To meet the EMC requirements stipulated in the CE standards, you must use symmetrical shielded cables as motor cables (as shown in the following figure).
Four-core cables can be used as input cables, but symmetrical shielded cables are recommended. Compared with four-core cables, symmetrical shielded cables can reduce electromagnetic radiation as well as the current and loss of the motor cables.

Note: If the conductivity of the shield layer of the motor cables cannot meet the requirements, separate PE conductors must be used.

To protect the conductors, the cross-sectional area of the shielded cables must be the same as that of the phase conductors if the cable and conductor are made of materials of the same type. This reduces grounding resistance, and thus improves impedance continuity.
To effectively restrict the emission and conduction of radio frequency (RF) interference, the conductivity of the shielded cable must at least be $1 / 10$ of the conductivity of the phase conductor. This requirement can be well met by a copper or aluminium shield layer. The following figure shows the minimum requirement on motor cables of a VFD. The cable must consist of a layer of spiral-shaped copper strips. The denser the shield layer is, the more effectively the electromagnetic interference is restricted.

Figure D-1 Cross-section of the cable

## D.4.2 Control cables

All analog control cables and cables used for frequency input must be shielded cables. Analog signal cables need to be double-shielded twisted-pair cables (as shown in figure a). Use one separate shielded twisted pair for each signal. Do not use the same ground wire for different analog signals.

Figure D-2 Power cable arrangement

For low-voltage digital signals, double-shielded cables are recommended, but shielded or unshielded twisted pairs (as shown in figure b) also can be used. For frequency signals, however, only shielded cables can be used.
Relay cables need to be those with metal braided shield layers.
Keypads need to be connected by using network cables. In complicated electromagnetic environments, shielded network cables are recommended.
Note: Analog signals and digital signals cannot use the same cables, and their cables must be arranged separately.
Do not perform any voltage endurance or insulation resistance tests, such as high-voltage insulation tests or using a megameter to measure the insulation resistance, on the VFD or its components. Insulation and voltage endurance tests have been performed between the main circuit and chassis of each VFD before delivery. In addition, voltage limiting circuits that can automatically cut off the test voltage are configured inside the VFDs.
Note: Check the insulation conditions of the input power cable of a VFD according to the local regulations before connecting it.

Table D-1 Recommended cable dimensions

| VFD model | Recommended cable size ( $\mathrm{mm}^{2}$ ) |  | Screw |  |
| :---: | :---: | :---: | :---: | :---: |
|  | R,S,T,U,V,W | PE | Terminal <br> screw | Fastening torque (Nm) |

## Note:

1. The numbers on the left and right of "/" indicate the recommended device parameters for G and P models, respectively
2. Cables of the sizes recommended for the main circuit can be used in scenarios where the ambient temperature is lower than $40^{\circ} \mathrm{C}$, the wiring distance is shorter than 100 m , and the current is the rated current.
3. The terminals P1, (+), and (-) are used to connect to brake accessories.

## D.4.3 Cable arrangement

Motor cables must be arranged away from other cables. The motor cables of several VFDs can be arranged in parallel. It is recommended that you arrange the motor cables, input power cables, and control cables separately in different trays. The output dU/dt of the VFDs may increase electromagnetic interference on other cables. Do not arrange other cables and the motor cables in parallel.

If a control cable and power cable must cross each other, ensure that the angle between them is 90 degrees.

The cable trays must be connected properly and well grounded. Aluminum trays can implement local equipotential.
The following figure shows the cable arrangement distance requirements.
Figure D-4 Cable arrangement distance

## D.4.4 Insulation inspection

Check the motor and the insulation conditions of the motor cable before running the motor.

1. Ensure that the motor cable is connected to the motor, and then remove the motor cable from the $\mathrm{U}, \mathrm{V}$, and W output terminals of the VFD.
2. Use a megameter of 500 V DC to measure the insulation resistance between each phase conductor and the protection grounding conductor. For details about the insulation resistance of the motor, see the description provided by the manufacturer.
Note: The insulation resistance is reduced if it is damp inside the motor. If it may be damp, you need to dry the motor and then measure the insulation resistance again.

## D. 5 Breaker and electromagnetic contactor

You need to add a fuse to prevent overload.
You need to configure a manually manipulated molded case circuit breaker (MCCB) between the AC power supply and VFD. The breaker must be locked in the open state to facilitate installation and inspection. The capacity of the breaker needs to be 1.5 to 2 times the VFD rated input current.

According to the working principle and structure of breakers, if the manufacturer's regulation is not followed, hot ionized gases may escape from the breaker enclosure when short-circuit occurs. To ensure safe use, exercise extra caution when installing and placing the breaker. Follow the manufacturer's instructions.

To ensure safety, you can configure an electromagnetic contactor on the input side to control the switch-on and switch-off of the main circuit power, so that the input power supply of the VFD can be effectively cut off when a system fault occurs.

Table D-4 Parameters of the optional accessories

| VFD model | Breaker rated current (A) | Fast-acting fuse rated current (A) | Contactor rated current (A) |

Note: Parameters of the optional accessories described in the preceding table are ideal values.

You can select accessories based on the actual market conditions, but try not to use those with lower values.

## D. 6 Reactors

When the voltage of the grid is high, the transient large current that flows into the input power circuit may damage rectifier components. You need to configure an AC reactor on the input side, which can also improve the current adjustment coefficient on the input side.
When the distance between the VFD and motor is longer than 50 m , the parasitic capacitance between the long cable and ground may cause large leakage current, and overcurrent protection of the VFD may be frequently triggered. To prevent this from happening and avoid damage to the motor insulator, compensation must be made by adding an output reactor. When a VFD is used to drive multiple motors, take the total length of the motor cables (that is, sum of the lengths of the motor cables) into account. When the total length is longer than 50 m , an output reactor must be added on the output side of the VFD. If the distance between the VFD and motor is 50 m to 100 m , select the reactor according to the following table. If the distance is longer than 100 m , contact INVT's technical support technicians.

Table D-5 Models of reactors

| GD350-110G-45-NS-B |  |  |  |  |

## Note:

1. The rated input voltage drop of input reactors is $2 \% \pm 15 \%$.
2. The rated output voltage drop of output reactors is $1 \% \pm 15 \%$.
3. The preceding table describes external accessories. You need to specify the ones you choose when purchasing accessories.

## D. 7 Filters

The product is shipped with J 10 jumper as standard.
Note: Disconnect J10 in the following situations:

1. The EMC filter is applicable to the neutral-grounded grid system. If it is used for the IT grid system (that is, non-neutral grounded grid system), disconnect J10.
2. If leakage protection occurs during configuration of a residual-current circuit breaker, disconnect J10.

Note: Do not connect C3 filters in IT power systems.
Interference filters on the input side can reduce the interference of VFDs (when used) on the surrounding devices.
Noise filters on the output side can decrease the radio noise caused by the cables between VFDs and motors and the leakage current of conducting wires.
INVT provides some of the filters for users to choose.

## D.7.1 Filter model description

## Note:

1. The input EMI meets the C 2 requirements after an input filter is configured.
2. The preceding table describes external accessories. You need to specify the ones you choose when purchasing accessories.

## D. 8 Brake system

## D.8.1 Brake component selection

When a VFD driving a high-inertia load decelerates or needs to decelerate abruptly, the motor runs in the power generation state and transmits the load-carrying energy to the DC circuit of the VFD, causing the bus voltage of the VFD to rise. If the bus voltage exceeds a specific value, the VFD reports an overvoltage fault. To prevent this from happening, you need to configure brake components.

| - | The design, installation, commissioning, and operation of the device must be <br> performed by trained and qualified professionals. <br> - Follow all the "Warning" instructions during the operation. Otherwise, major <br> physical injuries or property loss may be caused. |
| :--- | :--- |
| - Only qualified electricians are allowed to perform the wiring. Otherwise, damage |  |
| to the VFD or brake components may be caused. |  |
| Read the brake resistor or unit instructions carefully before connecting them to |  |
| the VFD. |  |
| Connect brake resistors only to the terminals PB and (+), and brake units only to |  |
| the terminals (+) and ( - ). Do not connect them to other terminals. Otherwise, |  |
| damage to the brake circuit and VFD and fire may be caused. |  |

Goodrive350 IP55 high-ingress protection series VFDs of 037G/045P or lower are equipped with built-in brake units, Select brake resistors according to the specific requirements (such as the brake torque and brake usage requirements) on site.

Table D-8 Brake unit signals

| VFD model | Brake unit model | Resistance applicable for 100\% brake torque ( $\Omega$ ) | Dissipated power of brake resistor (kW) |  |  | Min. allowable brake resistance ( $\Omega$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 10\% brake usage | 50\% brake usage | 80\% brake usage |  |

| GD350-110G-45-NS-B |  |  |  |  |  |  |

## Note:

1. Select brake resistors according to the resistance and power data provided by our company.
2. The brake resistor may increase the brake torque of the VFD. The preceding table describes the resistance and power for $100 \%$ brake torque, $10 \%$ brake usage, $50 \%$ brake usage, and $80 \%$ brake usage. You can select the brake system based on the actual operation conditions.
3. When using an external brake unit, set the brake voltage class of the brake unit properly by referring to the manual of the dynamic brake unit. If the voltage class is set incorrectly, the VFD may not run properly.

| 4 | Do not use brake resistors whose resistance is lower than the specified minimum <br> resistance. VFDs do not provide protection against overcurrent caused by resistors <br> with low resistance. |
| :---: | :--- |
| $!$ | In scenarios where brake is frequently implemented, that is, the brake usage is <br> greater than $10 \%$, you need to select a brake resistor with higher power as required <br> by the operation conditions according to the preceding table. |

## D.8.2 Brake resistor cable selection

Brake resistor cables need to be shielded cables.

## D.8.3 Brake resistor installation

All resistors need to be installed in places with good cooling conditions.

The materials near the brake resistor or brake unit must be non-flammable. The surface temperature of the resistor is high. Air flowing from the resistor is of hundreds of degrees Celsius. Prevent any materials from coming into contact with the resistor.

Installation of brake resistors

- VFDs of 037G/045P or lower need only built-in brake resistors.
- PB and $(+)$ are the terminals for connecting brake resistors.

Installation of brake units

| 1 | - <br> - + and $(-)$ are the terminals for connecting brake units. <br> The connection cables between the $(+)$ and $(-)$ terminals of a VFD and those of a <br> brake unit must be shorter than 5 m, and the connection cables between the BR1 <br> and BR2 terminals of a brake unit and the terminals of a brake resistor must be <br> shorter than 10 m. |
| :---: | :--- |

The following figure shows the connection of one VFD to a dynamic brake unit.

## Appendix E STO function description

Reference standards: IEC 61508-1, IEC 61508-2, IEC 61508-3, IEC 61508-4, IEC 62061, ISO 13849-1, and IEC 61800-5-2
You can enable the safe torque off (STO) function to prevent unexpected startups when the main power supply of the drive is not switched off. The STO function switches off the drive output by turning off the drive signals to prevent unexpected startups of the motor (see the following figure). After the STO function is enabled, you can perform some-time operations (such as non-electrical cleaning in the lathe industry) and maintain the non-electrical components of the device without switching off the drive.

## E. 1 STO function logic table

The following table describes the input states and corresponding faults of the STO function.

| STO input state | Corresponding fault |
| :---: | :--- |
| H1 and H2 opened simultaneously | The STO function is triggered, and the drive stops running. <br> Fault code: <br> 40: Safe torque off (STO) |
| H1 and H2 closed simultaneously | The STOP function is not triggered, and the drive runs <br> properly. |
|  | The STL1, STL2, or STL3 fault occurs. <br> One of H1 and H2 opened, and <br> the other closed |
| Fault code: <br> 41: Channel H1 exception (STL1) <br> 42: Channel H2 exception (STL2) <br> 43: Channel H1 and H2 exceptions (STL3) |  |

## E. 2 STO channel delay description

The following table describes the trigger and indication delay of the STO channels.

| STO mode | STO trigger delay $^{1}$ and indication delay ${ }^{2}$ |
| :---: | :--- |
| STO fault: STL1 | Trigger delay $<10 \mathrm{~ms}$ <br> Indication delay $<280 \mathrm{~ms}$ |
| STO fault: STL2 | Trigger delay $<10 \mathrm{~ms}$ <br> Indication delay $<280 \mathrm{~ms}$ |
| STO fault: STL3 | Trigger delay $<10 \mathrm{~ms}$ <br> Indication delay $<280 \mathrm{~ms}$ |
| STO fault: STO | Trigger delay $<10 \mathrm{~ms}$ <br> Indication delay $<100 \mathrm{~ms}$ |

1. STO function trigger delay: Time interval between trigger the STO function and switching off the drive output
2. STO indication delay: Time interval between trigger the STO function and STO output state indication

## E. 3 STO function installation checklist

Before installing the STO, check the items described in the following table to ensure that the STO function can be properly used.

|  | Item |
| :---: | :--- |
| $\square$ | Ensure that the drive can be run or stopped randomly during commissioning. |
| $\square$ | Stop the drive (if it is running), disconnect the input power supply, and isolate the drive <br> from the power cable through the switch. |
| $\square$ | Check the STO circuit connection according to the circuit diagram. |
| $\square$ | Check whether the shielding layer of the STO input cable is connected to the +24 V <br> reference ground COM. |
| $\square$ | Connect the power supply. |
| $\square$ | Test the STO function as follows after the motor stops running: <br> - If the drive is running, send a stop command to it and wait until the shaft of the motor <br> stops rotating. <br> - Activate the STO circuit and send a start command to the drive. Ensure that the motor <br> does not start. <br> - Deactivate the STO circuit. |
| $\square$ | Restart the drive, and check whether the motor is running properly. |
| $\square$ | Test the STO function as follows when the motor is running: <br> - Start the drive. Ensure that the motor is running properly. <br> - Activate the STO circuit. <br> - The drive reports an STO fault (for details, see section 5.5.19 "Fault handling"). Ensure <br> that the motor coasts to stop rotating. <br> - Deactivate the STO circuit. |
| $\square$ | Restart the drive, and check whether the motor is running properly. |

## Appendix F Acronyms and abbreviations

This chapter describes the terms or words corresponding to the acronyms and abbreviations that may be displayed on the interfaces of the keypad.

| Term/word | Acronym/ abbreviation | Term/word | Acronym/ abbreviation |
| :---: | :---: | :---: | :---: |
| Accumulated/ accumulation | Accum | VFD | Inv |
| Address | Addr | Leakage | Lkge |
| Amplitude | Amp | Lower limit | LowLim |
| Bridge | Brdg | Low-frequency | LwFreq |
| Coefficicent | Coeff | Low-speed | LwSp |
| Combination | Comb | Master/slave | M/S |
| Command | Cmd | Operation/operate/operator | Oper |
| Communication | Comm | Output | Outp |
| Compensation | Comp | Parameter | Param |
| Component | Cmpt | Password | Pwd |
| Consumption | Consume | Position | Pos |
| Control | Ctrl | Power | Pwr |
| Current | Cur | Proportional | Prop |
| Detection/detect | Det | Protect/protection | Prot |
| Differential | Diff | Quantity | Qty |
| Digital | Digi | Reference | Ref |
| Display | Disp | Resistance | Resis |
| Dynamic | Dyn | Reverse | REV |
| Eelectromotive force | Emf | Saturation | Satur |
| Emergency | Emer | Short-circuit | S/C |
| Error | Err | Source | Src |
| Factor | Fac | Speed | Spd |
| Feedback | Fdbk | Spindle | Spdl |
| Filter/filtering | Filt | Switch | Swt |
| Forward | FWD | System | SYS |
| Frequency | Freq | Temperature | Temp |
| Frequency point | FreqPnt | Terminal | Trml |
| Friction | Frict | Threshold | Thr |
| High-speed | HiSp | Torque | Trq |
| Identification/identity | ID | Upper limit | UpLim |
| Inductance | Ind | Value | Val |
| Initial | Init | Version | Ver |
| Input | Inp | Vibration | Vib |
| Instance | Inst | Voltage | Volt |
| Integral | Intg | Voltage point | VoltPnt |
| Interval | Intv1 |  |  |

## Appendix G Energy efficiency data

Table G-1 Power losses and IE class

| Model | Relative loss (\%) |  |  |  |  |  |  |  | Standby loss (w) | IE <br> class |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | (0;25) | (0;50) | (0;100) | (50;25) | $(50 ; 50)$ | $(50 ; 100)$ | (90;50) | $(90 ; 100)$ |  |  |

## Appendix H Further information

## H. 1 Product and service queries

Should you have any queries about the product, contact the local INVT office. Provide the model and serial number of the product you query about. You can visit www.invt.com to find a list of INVT offices.

## H. 2 Feedback on INVT VFD manuals

Your comments on our manuals are welcome. Visit www.invt.com, directly contact online service personnel or choose Contact Us to obtain contact information.

## H. 3 Documents on the Internet

You can find manuals and other product documents in the PDF format on the Internet. Visit www.invt.com and choose Support > Download.

The products are owned by Shenzhen INVT Electric Co.,Ltd.
Two companies are commissioned to manufacture: (For product code, refer to the $2 \mathrm{nd} / 3 \mathrm{rd}$ place of $\mathrm{S} / \mathrm{N}$ on the name plate.)

Shenzhen INVT Electric Co., Ltd. (origin code: 01)
Address: INVT Guangming Technology Building, Songbai Road, Matian, Guangming District, Shenzhen, China

INVT Power Electronics (Suzhou) Co., Ltd. (origin code: 06) Address: 1\# Kunlun Mountain Road, Science\&Technology Town, Gaoxin District, Suzhou, Jiangsu, China
